**REPORT ON  
INPUT SURVEY  
2001-02**

---

**Department of Economics & Statistics  
Thiruvananthapuram  
2008**

## Preface

The Ministry of Agriculture carried out the first Input survey as a part of the Agricultural Census Scheme in 1976-77 as the reference period. The present report brings out the consolidated State results of the Input Survey 2001-02 which is the sixth one in the series. The basic unit of survey is "Operational Holdings" as distinct from ownership holding, because Operational Holding is the basic unit of decision making for micro level planning.

The survey provides crucial information on use of variety of seeds, chemical fertilizers, organic manures, pesticides and IPM for irrigated and un irrigated areas separately. The survey also covers live stock held, use of agricultural machinery and implements and agricultural credits availed.

The data on Input Survey have been collected by Taluk Statistical Officers/Statistical Inspectors and supervised by District level officers of this department.

The State level supervision has been done by the State Technical Officer of the Scheme. Scrutiny and other related works have been done by the nuclear staff working in this scheme. Data processing, tabulation and estimation have been done by the computer division of this department.

I hope the report will be highly useful to planners, researchers and those who are interested in the field of Agricultural Statistics.

M.R. Balakrishnan

## **CHAPTER -I**

### **Introduction**

From the commencement of first Five Year Plan, various schemes were taken up to improve the contents and coverage of Agricultural Statistics and their accuracy. The planning and execution of Agricultural programmes are often handicapped for want of comprehensive and reliable data. Due to planned development and expansion of economy, new problems of formulation and execution of projects for more intensified and diversified development have become essential. This has necessitated further improvement of their quality and content of Agricultural Statistics. During the successive five year plans, a number of measures were taken up with a view to filling up gaps in the existing agricultural statistics and devise base and means of extending its scope.

In the past, approach to agricultural planning in India was mainly restricted to setting out targets of production for different crops and other agricultural commodities at the national and state levels. In the absence of detailed data on existing and potential resources for various agro-climatic reasons at the farm levels the task of planning from the grass root becomes difficult. At the farm level, it is the farmer who decides what to produce, when to produce and how much to produce. The programme and incentives which are given to the farmers should take into account awareness of the basic characteristics of the farmers holdings such as the size distribution, the pattern of land use, availability of water and the resources in human, animal and mechanical power on the farm. It is in this context that agricultural census / Input survey becomes important.

As a part of Agricultural Census Scheme, the input Survey is also being carried out in the country since 1976-77 on regular basis at five yearly intervals. The present report on Input Survey related to the period 2001-02 is the sixth in the series.

The detailed analysis of data on different parameters of the Input Survey may be seen in the reports. It is expected that different data users, particularly policy makers, administrators, researchers and various institutions concerned with Agricultural Statistics will find this report useful.

## **CHAPTER-II**

### **Concepts and definitions**

#### **Operational Holding**

'All land used wholly or partly for agricultural production and is operated as one technical unit by one person alone or with others, without regard to the title, legal form, size or location'. The technical unit has been defined as 'that unit which is under the same management and has the same means of production such as labour force, machinery and animals'. It is clear from this definition that the actual cultivator and not the owner is the unit for collection of data.

If, during the reference year, the entire area of the operational holdings is under current fallow, this will still be considered as an operational holding for Agricultural Census, but no information can be gathered in Input Survey from such holding. These holdings will not be included in the sampling frame for Input Survey.

#### **Parcel**

A parcel is all land entirely surrounded by land of other holdings or by land not forming part of any holding. It may consist of one or more cadastral units, plots or fields.

### **Operational holder**

The holder, for census purposes, is the person who has the responsibility for the operation of the agricultural holding. He exercises the technical initiative and responsibility for the operation of the holding and may have full economic responsibility.

### **Individual/ Joint Holding**

- i. If the holding is operated either by a person alone or group of persons who are members of the same household, it will be considered as individual operational holding.
- ii. If two or more persons belonging to different households share jointly as partners in the economic and technical responsibility for the operation of an agricultural holdings such holdings are considered as joint holdings.

### **Total area of holding**

The total area of the holding should include the total of all land forming part of a unit which is under the same technical responsibility and management. It should also comprise the land occupied by the farm buildings, including the house of the holder, provided such buildings are within the cultivated area. If the farm buildings are located outside cultivated area, then such buildings will not be included in the area of the holding.

### **Agriculture production**

Agricultural Production would mean the growing of field crops, fruits, grapes, nuts, seeds, trees nurseries (except those of forest trees), bulbs, vegetables and flowers, production of coffee, tea, cocoa, rubber, jute, oilseeds, grasses, etc..

If special efforts are made to raise grass, it would be treated as a crop for the purpose of the survey.

#### **Net Area Sown**

This would represent the total cultivated area during the reference year. Areas cultivated more than once during the same year will be counted only once. Both field crops and orchards will form part of the net sown area.

#### **Gross cropped area**

This includes the total area under all crops during the year. Total gross cropped area is greater than or equal to net area sown.

#### **Area under Current fallow**

This would include all the areas which are usually cropped but have not been cultivated during the reference year. For an area to be classified as current fallow, it should be fallow during the current year and should have been cultivated during the previous year. If an area is not being cultivated for more than one year, it will be categorized as old fallow or culturable waste.

#### **Area not available for cultivation**

This would include the following seven categories:-

- a) Fallow land other than current fallow: This should include all lands which were taken up for cultivation but are temporarily out of cultivation for a period of not less than one year and not more than five years.
- ii) Culturable waste: This should include lands available for cultivation, whether or not taken up for cultivation at any time. These are lands which were not cultivated during the current year and the last five years or more in succession for one reason or the other. Such lands may be either fallow or covered with shrubs and jungles which are not put to any use. Land once cultivated but not cultivated afterwards for five years in succession should also be included in this category at the end of the five years. Culturable waste land within the holdings would alone be covered for the Input Survey.

- iii) Permanent pastures and other grazing land: This should include all grazing lands, whether they are permanent pastures and meadows or not. Village common grazing land shall be excluded for the purpose of our Census.
- iv) Land under miscellaneous tree crops: This would include cultivable land, which is not included in the net area sown but are put to some Agricultural use. Lands under Casuarine trees, thatching grasses, bamboo bushes and 'Orchards' should be classed under this category. Lands of this type outside the holdings will not be included.
- v) Forests: Only private forests would be covered for the purpose of Agricultural Census and Input Survey.
- vi) Area under non-agricultural use: This should include all lands occupied by buildings, tanks and ponds put to uses other than agricultural purpose within the holdings.
- vii) Barren and uncultivated land: This should include all barren and within cultivated holding.

#### **Short Term Loan:**

Short term Loan are those which are given for seasonal agricultural operations and their repayment period is usually less than 18 months.

#### **Medium Term Loan:**

Medium term loans are advances for specific purposes. The repayment period is more than 18 months but less than five years.

#### **Long Term Loan**

These loans are provided in three or more installments for the development of land on project area basis and are capital intensive in nature. The period of long term loan exceeds five years.

## **Integrated Pest Management**

Traditionally there have been a number of practices adopted by farmers as plant protection measures. These practices could be categorized in four groups, viz., agronomic and cultural control, mechanical control, biological control and chemical control.

### **Agronomic and cultural practices**

This is a preventive method and is based upon knowledge of life history and habits of pest. The practices covered in this category include: deep ploughing after harvesting a crop to expose the hiding or resting insects, weeding, removing and destroying of stubbles and other trash, adjusting the time of sowing to avoid peak incidence period of pests. Clean cultivation, the removal of alternative wild hosts, crop rotations and choosing of insect and disease varieties.

### **Physical and Mechanical Control**

This is one of the oldest methods and includes measures, such as collection of eggs and caterpillars (in active stages if pests): removal and destruction of infested part of the plant, beating of drums, laying of night traps and yellow traps. These methods are found effective at initial state of the pest incidence when practiced by a large number of farmers in a particular area.

### **Biological Control**

Most of the crops have their natural enemies in the form of parasites and predators and disease causing organism. Large scale multiplication and liberation of such other agents, which naturally occur in environment but are enemies of enemies of crops (friends of crops) results in effective control of the harmful organisms. These methods are often applied by specialized agencies in

conjunction with chemical methods so that harmful effects of insecticide do not interfere with the activities of nature based enemies of pests.

### **Chemical control**

This methods relates to use of insecticides, pesticides and weedicides, which are used as dusts, sprays and granules on the crops. Because of their nature of producing immediate results such chemicals are most popular among the farmers. Serious limitations, particularly those relating to residues on crops and destruction of useful insects, have been noted in recent years in usage of these chemicals.

### **Chemical Fertilizers, Organic Manure, Green Manure and Bio-Fertilizers**

Package of practices followed for replenishing the nutrient losses from the soil as a result of cultivation to maintain the fertility of the soil involves use of organic manure, green manure, chemical fertilizers and bio-fertilizers. These are explained below:

#### **Chemical Fertilizers**

The chemical fertilizers refers to chemical compounds which are manufactured in factories and are used as soil nutrients. These are further classified as "macronutrients" which supply nitrogen (N), phosphate (P) and Potash (K) and "micronutrient" fertilizers which supply Zinc, Manganese, Copper, Iron, Aluminum etc. The popular macro nutrient fertilizers are Urea, DAP, MOP,CAN and a number of complex fertilizers and the physical mixtures of these.

#### **Organic Manure**

The Organic Manure is usually not manufactured in chemical factories and is produced by the farmers in their fields using various types of agricultural

wastes. Sometimes these are also prepared using the sewage silt or municipal waste in urban areas. The organic manure is usually bulky material and is transported in trolleys. The types of manures covered in this would be Farm Yard Manure (FYM), which is prepared by putting agricultural wastes in a pit for decomposition and composting. This would also include the Vermi Compost. The various forms of oil cakes which are used as fertilizers would also fall in this category.

### **Bio-fertilizers**

Bio-fertilizers are sold in small packets and require storage at specified temperature. These carry some living bacteria on organic base. The examples of bio-fertilizers are Rhizobium, Azabactor, Blue-green Algae and Phosphate Solubalising Bacteria (PSB). When bio-fertilizers are put in the soil, the bacteria contained in the fertilizer packet are spread in the soil and start their activity, e.g., fixing the nitrogen from air to soil. Hence bio-fertilizers are not soil nutrients in themselves, rather they act as catalysts/direct agents for making the soil nutrients available. These type of fertilizers are not very common among farmers and only some progressive farmers use them. Also because of their storage requirements these are not available everywhere.

### **Green Manure**

Green manure refers to cultivation of a specific type of vegetation with the intention of ploughing it back in the soil when the leaves are tender and easily decomposable. The popular types of green manure used by the farmers include Sesbania (Dhencha), Sunhemp (Sanai), Indigo, Urd and Cowpea. There is also a practice of ploughing back the leafy portion of leguminous crops in the field after first or second picking for the purpose of green manuring. All such cases will be counted for the purpose of obtaining area under green manure.

## Chapter -III

### Sampling Design and Estimation Procedure

#### Objective

The main objective of the survey is to generate data on various agricultural inputs according to major size group of operational holdings viz. marginal (below 1 hectare), small (1 to 2 hectare), semi-medium (2-4 hectare) medium (4 to 10 hectares) and large (10 hectare and above), for getting an insight into the consumption pattern of inputs by various categories of farmers. This information is vital for planning their production, inputs and distribution. The inputs covered in the survey include seeds, fertilizers, pesticides, farm yard manures, bio fertilizers, agricultural implements and machinery, live stock and agricultural credits.

#### Scope and Coverage:

All the individual and joint holdings operated by resident cultivators constitute the population of the survey. The survey covers all type of agricultural holdings except institutional holdings. Boundary of the survey was district.

#### Reference Period:

The reference period of the survey was July 2001-June, 2002.

#### Items covered in the Survey

Under the Input Survey 2001-2002 information was collected according to size class of operational holding for the following items.

- (1) Number of parcels
- (2) Multiple cropping, separately for irrigated and unirrigated areas.

- (3) Use of fertilizers, organic manures and pesticides, separately for irrigated and unirrigated areas under major crops. (Area covered and quantity used)
- (4) Live stock held (numbers)
- (5) Use of Agricultural machinery and Implements
- (6) Agricultural credit availed.
- (7) Type of seeds used and quality problems if any
- (8) Integrated Pest Management (IPM) practices.

#### **Unit of collection of data**

The basic unit for which data for various parameters of the input survey were collected was "operational holding".

#### **Sample size and Methodology**

A two stage stratified sampling was adopted for the input survey 2001-02. Blocks/Municipalities/Corporations constitute the strata, wards within a stratum form first stage unit (FSU) and operational holdings in the selected wards constitute the second stage unit (SSU). The sample size of the 'FSU' was 7% of the total number of wards. From each Stratum i.e. 35% of the wards selected randomly out of the 20% wards already selected for phase I and II of Agricultural Census 2000-01. In a selected ward all the operational holdings was categorized into the following size groups.

Sl.No.	Size Groups
1.	Below 1 hectare
2.	1 to 1.99 hectare
3.	2.00 to 3.99 hectares
4.	4.00 to 9.99 hectares
5.	10 hectares and above.

A simple random sample of four operational holdings was selected from each of the above size groups. The data were collected through household enquiries from the selected operational holders.

**Schedules used:**

The following schedules were used in input survey 2001-02.

1. Schedule -0 = Information on number of wards selected in Blocks /Municipalities/Corporations
2. Schedule -1 = List of operational holdings and record of selection in the selected wards.
3. Schedule 2.0 = Information on holdings in the selected ward in the Blocks/Municipalities/Corporations
4. Schedule 2.1 = Parcel wise details of area under multiple cropping according to irrigated and unirrigated conditions during the agricultural year 2001-2002
5. Schedule 2.2 = Area under irrigated / un-irrigated crops and use of fertilizers, pesticides etc. during the agricultural year 2001-02
6. Schedule 2.3 = Inventory of Livestock and Poultry as on 15.10.2002
7. Schedule 2.4 = Agricultural machinery and implements used during 2001-02
8. Schedule 2.5 = Agricultural credit
9. Schedule 2.6 = Seeds and Integrated Pest Management (IPM) practices.

### ***Estimation Procedure***

For estimating the population totals of various characteristics in the input survey 2001-02, "simple unbiased estimates" method was adopted which is described below.

#### **Notations and Terminology**

1.  $Y_{ijp}(k)$  = value of characteristic in the  $p^{\text{th}}$  holding of  $j^{\text{th}}$  ward of  $i^{\text{th}}$  Block/Municipality/Corporation (Stratum) in the  $k^{\text{th}}$  size class
2.  $N_{ij}(k)$  = Total number of holdings in the  $k^{\text{th}}$  size class in the  $j^{\text{th}}$  sample ward of the  $i^{\text{th}}$  Block/Municipality/Corporation
3.  $n_{ij}(k)$  = Number of holdings sampled in the  $k^{\text{th}}$  class in the  $j^{\text{th}}$  selected ward of the  $i^{\text{th}}$  Block/Municipality/ Corporation
4.  $N_i$  = Total number of wards in the  $i^{\text{th}}$  Block/Municipality/Corporation
5.  $n_i$  = Number of wards selected in the  $i^{\text{th}}$  Block/Municipality/Corporation
6.  $\hat{Y}_T(k)$  = Estimate of characteristic under study for the  $i^{\text{th}}$  Block/Municipality / Corporation in the  $k^{\text{th}}$  size class
7.  $\hat{Y}_D(k)$  = Estimate of characteristic under study for the district in the  $k^{\text{th}}$  size class
8.  $M$  = Number of Blocks / Municipalities / Corporation in the district

Then the estimate of the characteristic under study for the  $i^{\text{th}}$  Block/Municipality/ Corporation (ie. Stratum) in the  $k^{\text{th}}$  size class is given by the formula

$$\hat{Y}_T(k) = \frac{\sum_{j=1}^M \frac{N_i}{n_i} \frac{n_{ij}(k)}{n_{ij}} \sum_{p=1}^{n_{ij}(k)} Y_{ijp}(k)}{(1)}$$

And for the district, it becomes

$$\hat{Y}_D(k) = \sum_{i=1}^M \frac{N_i}{n_i} \sum_{j=1}^{n_i} \frac{n_{ij}(k)}{n_{ij}} \sum_{p=1}^{n_{ij}(k)} Y_{ijp}(k) \quad (2)$$

$$M \quad \hat{Y}_T(k) \\ = \sum_{i=1}^M Y_D(k)$$

## Chapter-IV

### Analysis of Input Survey Data

#### Distribution of Operational Holdings and Operated Area

According to Input Survey 2001-02 the total number of operational holdings was 65.76 lakhs against the operated area of 15.78 lakhs ha (excluding institutional holdings). The corresponding figures as per Agricultural Census 2000-01 were 66.57 lakhs against the operated area of 15.69 lakhs.

Thus both the surveys were very close in estimating the total number of holdings and operated area in the state. Since the Input Survey, institutional holdings and other type of holdings are excluded, it is normally expected that the number and area of holdings as per the input survey should be less than the corresponding data of Agricultural Census, although Input Survey is carried out after one year of the Agricultural Census but here a marginal increase is seen in the case of area.

#### Dispersal of Operational Holdings

A parcel has been defined as "all land entirely surrounded by land of other holdings or land not forming part of any holding". It may consist of one or more cadastral units or fields and may not be synonymous with survey number. Three or four adjoining survey numbers could make one parcel but two survey numbers of the same Panchayath ward not adjacent to each other, would make two parcels.

An Operational holding may consist of one or more than one parcel. The more the number of parcels, the more scattered will be the operational holding. All the parcels comprising an operational holding may lie within the ward of residence of the holder or might even be spread over one or more other wards.

The data on number of parcels was collected by interviewing the selected operational holder with a view to have information about the dispersal of operational holdings in different parts of the country. However, the outer limit for collecting the information in Input Survey was restricted to the district. Since an Operational Holding will have at least one parcel, the average number of parcels per Operational Holding cannot be less than one. The distribution of average number of parcels, average area per parcel and average area per holding in different size groups as per input survey 2001-02 may be seen in Table I.

Table -I

Sl. No.	Size Group (Ha)	Total holdings		Total No. of parcels	Average No. of parcels per holding	Average area per parcel (ha)	Average area per holding (ha)
		No.	Area				
1	< 1.0	6264072	986991	6721072	1.07	0.15	0.16
2	1.0- 1.99	222007	295466	453295	2.04	0.65	1.33
3	2.0- 3.99	73170	185764	299686	4.10	0.62	2.54
4	4.0- 9.99	14939	79332	122341	8.19	0.65	5.31
5	>10	1784	30989	18553	10.40	1.67	17.37
	All groups	6575972	1578542	7614947	1.16	0.21	0.24

From the above table it can be observed that the number of parcels per holding for all size groups was 1.16 in 2001-02 against 2.0 in 1996-97. This shows that the number of parcels per holding had decreased. This may be due to the fact of selling some of the parcels by the operational holders. The trend in the number of parcels per holding over the period of times in each type of holdings is diminishing.

The average area per parcel for all groups at state level was 0.21 ha during 2001-02 against 0.19 ha in 1996-97. This shows a marginal increase.

The average operated area per holding for all size groups was 0.24 ha in 2001-2002 against 0.32 ha in 1996-97, which showed a decline. This is due to the inverse relationship between number and area of operational holdings.

Table -II

Sl. No.	Size (Ha)	Gross Cropped Area			Current fallow Land	Other Un cultivated land
		Irrigated area	Unirrigated Area	Total Area		
1	< 1.0	173718	699884	873602	23972	142022
2	1.0-1.99	77890	213705	291595	11028	18006
3	2.0-3.99	53739	134563	188302	6125	9165
4	4.0-9.99	25186	56517	81703	2181	3155
5	> 10	10252	21316	31568	416	1252
	All groups	340785	1125985	1466770	43722	173600

The gross cropped area is 14,66,770 ha. Of which 3,40,785 ha. is irrigated and 11,25,985 ha is unirrigated i.e., 23.23% is irrigated and 76.77% is unirrigated.

Table- III

Sl. No.	Size (Ha)	Irrigated Area		Unirrigated Area	
		Gross area	Net Area	Gross Area	Net Area
1	<1.0	173718	161913	699884	659074
2	1.0-1.99	77890	71086	213705	195348
3	2.0-3.99	53739	48722	134563	121731
4	4.0-9.99	25186	23178	56517	50813
5	>10	10252	9466	21316	19843
	All groups	340785	314365	1125985	1046809

From the above table, it can be observed that the irrigated area (both gross and net) shows a diminishing trend where as a marginal increase is seen in the net area un irrigated when compared to the previous survey.

The method of multiple cropping is used as an indicator of the intensity of land utilization. The percentage of area cropped once is 77.81 in irrigated area where as that in unirrigated area is 96.82. The percentage of area cropped twice and more than twice in irrigated area are 21.39 and 0.8 respectively. But the percentage of area cropped more than twice in unirrigated area is 3.18 only. The result shows an increase in irrigated area from 1996-97 to 2001-2002 i.e from 70.52% to 77.81%, and a decrease in irrigated area cropped twice and cropped more than twice i.e from 27.18% to 21.39% and from 2.3% to 0.8% respectively. Similarly there is an increase in unirrigated area from 1996-97 to 2001-02, i.e. from 92.43 to 96.82, but a decrease in unirrigated area cropped more than twice, i.e. from 7.57% to 3.18%. This means that the cultivators show least interest in multiple cropping.

Table C<sub>3</sub> shows a decrease in the percentage of gross cropped area by irrigation status during 2001-02 from 1996-97. The percentage of gross cropped area in 2001-02 is 23.23 and that in 1996-97 is 24.77. The percentage of gross cropped area shows lack of irrigation facilities or under utilization of available irrigation potentials.

Table C<sub>4</sub> indicates that the average gross cropped area per operational holding is decreased from 0.53 hectares in 1996-97 to 0.22 hectares in 2001-02. This may be due to the increase in the number of operational holdings.

The intensity of cropping is the ratio of gross cropped area to net cropped area. From table C5 it is seen as 1.08 in the survey period 2001-02. The intensity ratio was 1.48 in 1986-87, 1.45 in 1991-92 and 1.14 in 1996-97. This shows that there is a decreasing trend in gross cropped area. Gross cropped area under irrigated crop was 340785 hectares and unirrigated crop was 1125985 hectares. Net area under irrigated crop was 314365 hectares and for unirrigated crop, it was 1046809 hectare.

From table C6, it can be observed that 17.5% was occupied by paddy and 84.29% of irrigated area under paddy covers high yielding varieties. 4.92% of gross area under unirrigated crop is paddy where as 63.61% of this area is used for high yielding varieties of paddy. Again it can be seen that even though there was huge short fall in the percentage of irrigated area under paddy, percentage area under high yielding variety is increasing.

From table C7, it is seen that the percentage of gross cropped area of paddy during the year 2001-02 was 7.85 while that during the year 1996-97 was 20.60. Here a decrease of 62% is seen. For coconut, the percentage of variation

compared to that of the year 1996-97 is 20% (increase). In short coconut was the most dominant crop having a share of about 33.91% of gross cropped area followed by rubber (19.61%), Paddy (17.85%) etc.. See table C8 and C9.

### *Crop wise use of Inputs*

#### **Application of Chemical fertilizers.**

Chemical fertilizers is used to increase agricultural production and pesticides and IPM to protect the crop from insects and pests. Besides chemical fertilizers, organic manure is also used to enhance the soil fertility. The most commonly used chemical fertilizers are urea, potash, factomphos super sulphate and Ammonium phosphate. On the other hand Farm yard Manure (FYM) / compost and oil cake are the most common organic manures used by the cultivators. The input survey data were collected separately for area under high yielding and others and quantity of fertilizers used. Normally the first dose of fertilizer is given at the sowing stage and subsequently one or more applications are given to the crop. Thus the same area may receive one or more application of fertilizers but for the purpose of estimation of area fertilized, only net area under the crop in a particular season has been taken in to account.

It may be seen from the table C10 that the number of holdings irrigated are 1419003 in an area of 340756 hectare. Out of 14,19,003 holdings growing one or more irrigated crops, 755047 holdings are treated with one or more chemical fertilizers (53.2%) in an area of 214385 hectares (62.91%). Also 88.16% of irrigated area cultivating High Yield Varities was treated with chemical fertilizers. In the case of other varieties in irrigated area, 48.92% area are treated with one or more chemical fertilizers (see table C11)

The average consumption of NPK in irrigated area according to the quality of fertilizers treated per hectare were 40.98, 46.33 and 42.27 kg. respectively. (See table C12).

### **Application of Straight Fertilizers (Irrigated area)**

The result of table C13 and C14 show that urea is the most commonly used chemical fertilizer i.e. 36.19% of the holdings comprising of 62.91% of area were treated with urea. The usage of potash stands in the second place i.e. 33.11%, of holdings and the area is 42.78% of irrigated area. It is seen that Ammonium Phosphate is the least used fertilizer.

### **Consumption of mixed fertilizers in irrigated area**

The main fertilizers commonly used are Vijay 17:17:17 and factomphos. The percentage of usage is 15.89% and 14.03% respectively in irrigated area under all crops. (See Table C15, C16)

### **Crop wise Consumption of chemical Fertilizers (Irrigated)**

The application of chemical fertilizers for paddy in High Yielding variety was 92.25% while 60.32% of area under traditional varieties was treated with chemical fertilizers.

Average consumption of N, P, K under irrigated paddy were 69.94, 29.71 and 60.51 kg./hectare respectively (See table C 19).

The percentage of number of holdings growing Tapioca treated with chemical fertilizer were 39.46 where as chemical fertilizer were used in 49.33% of area growing Tapioca in irrigated area (Table C20).

37.74% of irrigated area growing coconut was treated with chemical fertilizers. Average quantity of NPK consumed per hectare was 296.78 & 303 Kg./hectare respectively (Table C21)

63% of irrigated area under rubber was treated with chemical fertilizer. The quantity of NPK consumed was calculated as 34.5, 19.9 and 15.9 kg / hectare respectively (Table C 22)

Considering other food crops, 26.7% of area was treated with chemical fertilizer. The estimated quantity of N,P,K nutrients being 2.6, 2.2, 2.0 kg./hectares respectively

[Table C 23]

### **Chemical Fertilizers in Unirrigated Area**

There are 56,62,196 unirrigated holdings and the corresponding area is 11,26,005 hectares. 34.98% of unirrigated holdings growing one or more crops was treated with chemical fertilizers. In respect of unirrigated area under High Yielding Variety, 77.28% of area was treated with chemical fertilizers where as for traditional verities, it was only 32.16 % [Table C 24,].

Average consumption of N,P,K were estimated as 40.98, 46.33 & 42.27 in irrigated area and 27.4, 25.2 and 30.8 in unirrigated area respectively. Potash is seen as the main straight fertilizer i.e 14.81% of area was treated with potash. Urea stands in the second place and 11.26% of area was treated with urea.

Vijay 17:17:17 was the most important complex / mixed fertilizer used in un- irrigated area (14.11%) followed by factomphos (5.92%) [Table C27 to C29]

85.65% of unirrigated area under paddy were treated with chemical fertilizers. For high yielding varieties of paddy in unirrigated area 95.05% of area were used with chemical fertilizer whereas for other varieties it was only 69.22%. Average use of N, P, K for paddy in unirrigated area were 49.97, 18.36 and 37.01 kg./hectares respectively.

43.34% of area under Tapioca in unitrigitated area was treated with chemical fertilizers and 21.66% of area under coconut also was treated with chemical fertilizer. The average consumption of N, P, K being 12.04, 12.89, 21.92 kg/hectare [Table 34, 35]

It is clear from table C 36 that 72% of area under Rubber in unirrigated area were treated with chemical fertilizers. The average consumption of N, P, K was 46.4, 50.02, 4153 respectively. Only 12.34% of area was treated with chemical fertilizer when other food crops are considered. The use of N, P, K was 10.02, 12.91 and 13.29 kg./ hectare respectively.

### Organic Manure in irrigated and unirrigated areas

Nearly 34.29% of holdings having an area of 424609 hectares (28.95%) used Farm Yard Manure / compost/Biogas manure in irrigated area. Green manures were used in 30.93% of holdings, the area benefited being 252845 (17.24%). High Yielding Varieties of paddy were used in 23.16% of area whereas

other varieties were used in 31.27% of area. Area covered by other organic manure was 10385 hectares (20.66%) for paddy (HYV), whereas for others it was 1643 (17.54%). The area of Coconut treated with farm yard manures was 37.07% whereas for Tapioca it was 20.97%.

### **Plant Protection Chemicals and Pesticides**

The plant protection in respect of high yielding varieties of paddy was 71.53% and for other varieties it was 43.7%.

### **Agricultural Machinery & Implements**

During 2001-02, the number of Agricultural machinery commonly used were

1. Hand operated Sprayers	- 454421
2. Wooden Plough	- 60826
3. Steel Plough	- 13281
4. Power Sprayers	- 18679
5. Diesel Engine Pump sets	- 67457
6. Electric Pump sets	- 785935
7. Power Trailers	- 114813
8. Tractors	- 148663

[Table C 44]

It is seen that the Agricultural machinery & implements except Hand operated sprayers, Electric Pump sets, Power Trailers used are less in number when compared with Input Survey 1996-97.

## Agricultural Credit

The number of operational holdings taking institutional credit was reported as 4,68,314 which came to be 7.12% only. The average amount availed / holder increased from 5688 (1996-97) to 8936 (2001-02) [Table C45, C46].

During the survey period Rs.418.49 crores were given as advance to 4,68,314 holdings through various financial institutions. The details of the percentage distribution of holders' availed loan through different types of Co-operative institutions are described in table C 47.
