PREFACE

Civil Registration System is a continuous, permanent and compulsory recording of the occurrence and characteristics of vital events, like births, deaths and still births. The main objective of the Civil Registration System is to record the annual change in population at national and state level between two successive decennial Censuses. The registration of births and deaths has been made statutory through Registration of Births and Deaths Act 1969, which came into force in the State on 1st April 1970 vide Government of India Gazette Notification dated 21st March 1970 along with many other States.

The registering authorities at the local bodies are Secretaries of Grama Panchayats, Health Inspectors of Municipalities, Health Officers of Corporations and the Executive Officer of Kannur Cantonment. This report titled "Annual Vital Statistics Report 2017" provides an overview of the working of the Civil Registration System (CRS) in the state and presents a compilation of data on registered births, deaths, infant deaths and still births with rural-urban & sex-wise break-up based on Civil Registration Records.

The report was prepared by the Vital Statistics division of this office under the supervision and leadership of Shri P.V.Babu, Additional Director (General) & Additional Chief Registrar of Births & Deaths. The sincere efforts put in by Smt.Supriya.G, Statistical Assistant Gr.II, Smt. Sindu Mol.K.G, Statistical Assistant Gr.I, Smt.S. A Suma & Sri. B. R. Rajesh Kumar, Research Assistants and the timely advice and guidance given by Sri. C. Madhavan, Deputy Director, Vital Statistics Division to bring out this publication are very much appreciated.

I would like to place on record my appreciation for the co-operation and valuable services rendered by the IKM, Local Registrars, District Registrars, Deputy Directors and staff of the District Offices of Economics & Statistics for bringing out this publication.

Chapter -1

The Civil Registration System in Kerala

1.1 Introduction

Registration of births and deaths is an important source for demographic data for socio-economic development and population planning. In India, the need for dependable demographic data was felt soon after independence heralding the era of Five Year planning. In the beginning, the registration of births and deaths started on voluntary basis and there was no uniformity in statistical returns resulting in both under registration and incomplete coverage. In order to unify the civil registration activities, the Civil Registration System (CRS) was introduced in India under the Registration of Births and Deaths Act (RBD Act), 1969. Civil Registration System may be defined as a continuous recording of vital events such as births, deaths and marriages occurring in a population. The basic uses of data from Civil Registration System are

- Maintenance of permanent records on births and deaths as legal documents.
- Assessment of continuous changes in population.
- Evaluation of success of socio-economic programmes by indicators based on vital events and size of population.

As a matter of fact, requirement of this system as legal proof of births and deaths should in itself be strong enough reason for any country to have a fully operational CRS. In India the registration of vital events and the administrative machinery for this purpose has been in existence for more than a century. It had been working under diversified Acts and executive instructions thus making it unsuitable for the independent India.

1.2 Registration of Births and Deaths Act 1969

This Act replaced the then existed laws and unified the system of registration throughout the country. Under the RBD Act the registration of births and deaths is made compulsory. It has become mandatory on the part of head of house hold or his representative to report and register domiciliary vital events, for medical officers in charge of medical institution in respect of births and deaths occurring in these institutions. The Act also provided the statutory authority at Centre, State, District and local level. It prescribed definitions, principles, personnel and penalties connected with enforcement of the Act. It enabled Central Government to insist uniformity in registration procedures and bring out comparability in vital statistics registered in different parts of the country.

Statistics of births and deaths are compiled on the basis of Civil Registration System introduced under the Registration of Births and Deaths (RBD) Act, 1969. It is required under the Act that each vital event should be reported within 21 days from the date of occurrence of the event. This Act also provides for registration of events beyond 21 days on payment of some penalty. In the case of large delays registration can only be done after taking the permission of the District Magistrate.

National Level

At national level the Registrar General of India (RGI) administers CRS. He is empowered to issue general directions and take steps to co-ordinate and unify the activities of Chief Registrars of the States, who are the Chief Executive authority in the

states for executing the provisions of RBD Act 1969 and the rules and orders made there under. They were responsible for coordinating, unifying and supervising the work of CRS within their respective state.

State Level

The Registration of Births and Deaths Act 1969 (Central Act 18 of 1969) came into force in Kerala on 1st April 1970 by the Government of India Gazette notification dated 21st March 1970 along with many other states. The Kerala Registration of Births and Deaths Rules 1970 published in G.O.(P)No.7/70/LAD dated 29th June 1970 by S.R.O.No.262/70 Gazette dated 1st July 1970 have been approved by the Government of India under section 10(1) of the said Act.

As per the circular No.6/4/97/VS(CRS) dated 31/5/1999 of the office of the Registrar General of India, the revamped Civil Registration system was introduced with effect from 1/01/2000. In tune with the newly introduced system, the Registration of Births and Deaths Rules 1970 was replaced with the new rules, viz Kerala Registration of Births and Deaths Rules 1999 and it was published as per the order G.O.(P)No.8/2000/LSGD dated 06/01/2000.

1.3 Organizational Setup in the State

- **Chief Registrar**
The Director of Panchayaths, Government of Kerala is the Chief Registrar of Births and Deaths.
- **Additional Chief Registrar**
The Additional Director General of Economics and Statistics Department is designated as the Additional Chief Registrar of Births and Deaths.

Deputy Director of Economics and Statistics, Vital statistics division has been designated as Deputy Chief Registrar to assist Additional Chief Registrar for release timely birth & death statistics.
- **District Registrars**
The Deputy Director of Panchayaths of the 14 districts in the State are functioning as the District Registrars. The Secretaries of Corporations, Municipalities and the Executive Officer of Kannur Cantonment area are exercising the powers of District Registrars.
- **Additional District Registrars**
The Deputy Directors of the 14 District Statistical office are functioning as the Additional District Registrars of Births and Deaths of respective revenue districts.

- **Registrars**

The Secretaries of Grama Panchayats, Health Officers of Corporations, Health Inspectors of Municipalities and Executive Officer of Kannur Cantonment area are functioning as the Registrars of births and deaths.

1.4 The Process

The data reporting forms contain details of birth, death and still birth. Birth registration form contains information on date of occurrence/registration, usual residence of mother, place of birth, sex and weight of the child, order of birth, type of medical attention at birth, type of delivery and characteristics of the parents including their name, age, religion, educational status, occupation etc. In the case of death, information includes name, sex, age, marital status, religion, occupation, usual residence of the deceased, place of occurrence, date of occurrence/registration, cause of death, whether medically certified or not and kind of medical attention received at the time of death and characteristics of the mother, pregnancy period etc. in the case of still births. These forms have two parts: legal and statistical. The statistical part of the vital events registered in the registration units are entered in to the Sevana software developed by IKM, Kerala. The Vital Statistics Division of the DES prepares this report as per the methodology and instructions issued by the Registrar General of India (RGI) from time to time. The report contains district-wise statistics of births, deaths, infant deaths, still births and the related vital rates.. Information Kerala Mission (IKM) has provided “Sevana” package in all the Grama Panchayats, Municipalities and Corporations for registration of births and deaths and issue of certificates.

1.5 Limitations of the data

As far as the level of registration is concerned Kerala has attained cent percent record in the registration of births and 99.5 percent in the case of deaths. Some events are seen unregistered. This may be due to lack of awareness about the need and importance of registration of births and deaths and lack of registration procedure knowledge among the public. This may affect the quality of the statistical data. Efforts are being taken to create mass awareness about the importance and necessity of registration. More over Cochin Corporation was not sharing data through IKM (Sevana Software) and hence their data could not included in this report for calculating Vital Rates.

1.6 Status of Reporting

The local bodies, viz., the Grama Panchayats, Municipalities and Corporations function as the registration units of vital events in the State. Place of Occurrence of events and Year of Registration are the criteria used in the report for compiling vital events. Total Registration units existing in the State are 1035units. The details of registration units (Rural& Urban) are given in table A1. Utmost care has been given for the above process avoiding duplications and omissions, and eventually a cent percent reporting was achieved both in rural as well as urban areas.

Chapter -2
Analysis of Vital Events – Live Births

2.1 Registered live births

Total number of live births registered during the year 2017 was 503597. Out of the total live births registered, 256414 are male births, 247159 are female births and the remaining 24 cases are not reported its sex. It is seen that more males (50.92%) were born than females (49.08%) which resulted to a sex ratio at birth of 964 females per 1000 males.

The following Table 2.1(i) shows the registered live births by sex. Also the chart 2.1(i) presents the pictorial presentation of percentage of live births registered by sex

According to the number of live births registered by area, 139064 births (27.61%) were reported from rural areas and 364533 births (72.39%) from urban areas. The following Table 2.1(ii) give the registered live births and the chart 2.1(i) shows the pictorial

presentation of percentage of live births registered by area. It is observed that the percentage share of live births registered in rural area is lower than that of urban area.

2.2 Time Gap in Registration of Birth

The registered births has been classified in four categories depending upon their period of registration. The four time periods considered for the purpose are: i) within prescribed time limit (up to 21 days), ii) After 21 days but within 30 days, iii) After 30 days but within 1 year, iv) More than 1 year. Under the RBD Act 1969, all vital events are to be registered within 21 days from the date of occurrence of the event. Even though there exists a system of birth registration at the place of delivery (hospital) through the institution concerned, there were delayed registrations still prevails. The percentage of registration achieved out of total registration undertaken in the year 2017 within the prescribed time limit (up to 21 days) is 78.40% in rural area and 85.63% in urban areas. During the year 2017, 21.60% births registered were reported as delayed registration in rural area where as in

urban area, delayed registration reported is 14.37%. District wise details of time gap in registration of live births are given in Table B3(i), B3(ii) and B3(iii).

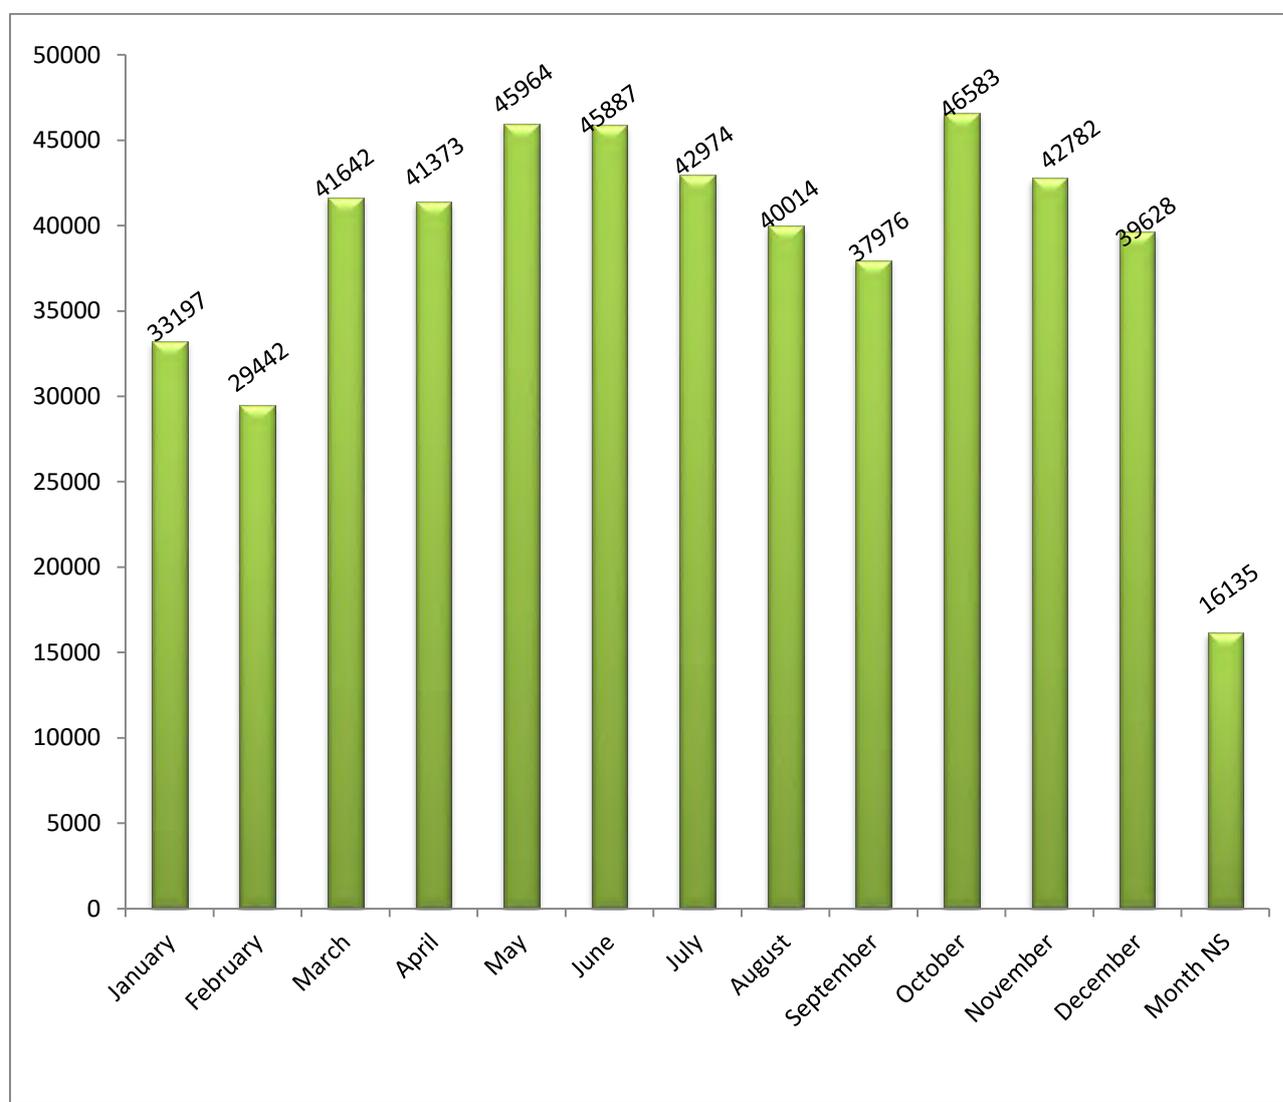

2.3 Live births by month of occurrence

In 2017, highest number of births occurred in October with 46583 (9.25%) of the total births in the State. It was followed by the months of May (9.13%), June (9.11%), and November (8.50%). The month of February (5.85%) had the least number of births in 2017. The month wise live births registered during 2017 are shown in the following table 2.3 and chart 2.3.

2.4 Sex ratio at births by Districts

The Sex Ratio (Number of females per thousand males) at birth is an important indicator to map the sex differential of the population at the beginning of their life. The sex ratio at birth has been calculated for districts for the year 2017 and is shown below in the following table 2.4. While analyzing the district wise Sex Ratio at birth, it is evident that the highest Sex Ratio at birth during the month of May and the lowest during the month of February. The month wise Sex Ratio at birth during 2017 are shown in Table 2.4 and chart 2.4. It is seen that sex ratio at birth is highest in Wayanad, followed by Pathanamthitta and Kottayam and the lowest in Kasargod district.

2.5 Medical attention received at the time of birth

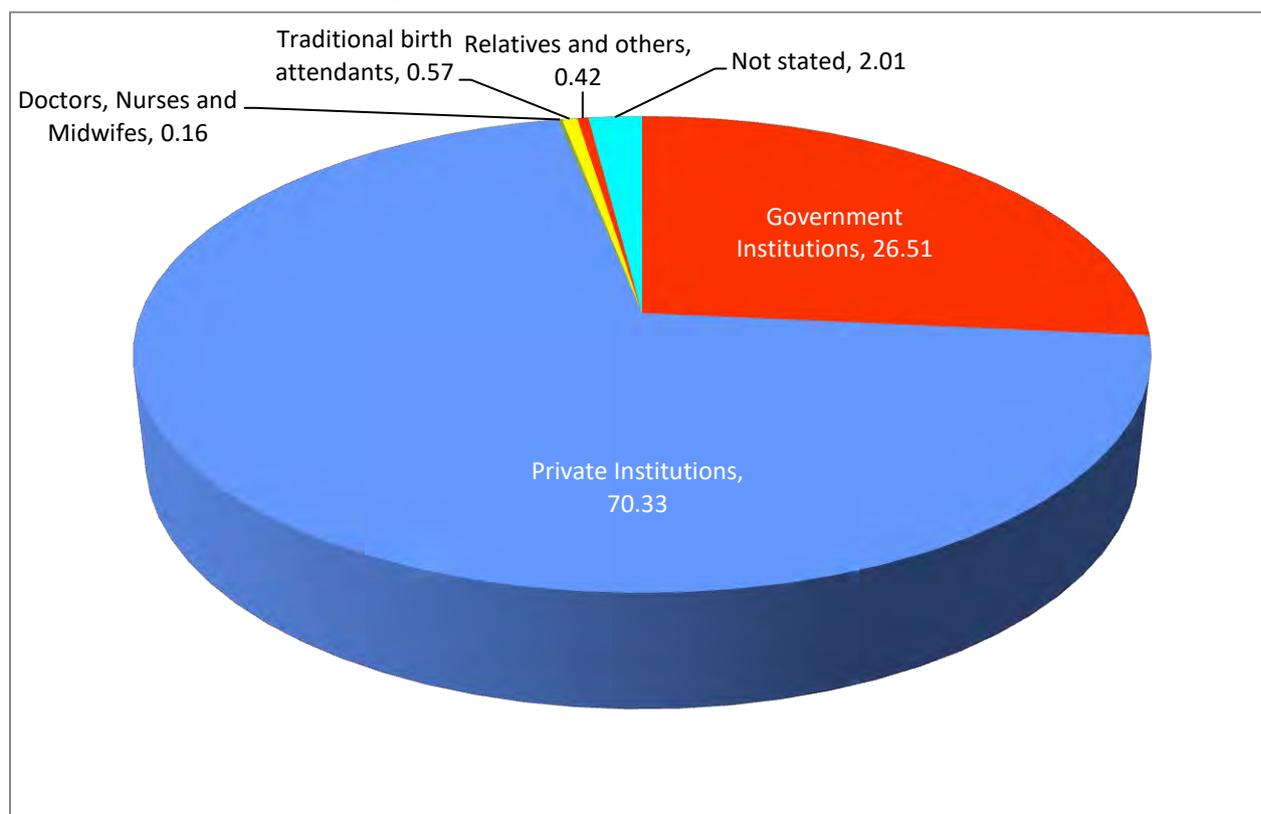

The percentage distribution of medical attention received at the time of birth has been given in the following table 2.5(i). The data shows that majority of births have been occurred

in an institution, either in Government or private hospitals. Out of total births registered during 2017, Institutional births occurred in 96.84% of cases, 0.16% of the cases were attended by the Physicians/Nurse/Midwife. However, about 0.57% of the events are still attended by traditional birth attendant and another 0.42% by Relatives and others.

It is seen that out of 139064 live births in rural area, 96.17 % events are reported as institutional birth and in the case of urban area, the corresponding rate is 97.10%.

In spite of having enough medical facilities across the State, a small percentage of live births (1.84%) is still attended by traditional birth attendant/relatives in rural area and 0.09% in urban area.

2.6. Live birth by Type of institution and Method of delivery

. Delivery or childbirth can be categorized on the basis of place of delivery, type of delivery (normal/caesarean section) and the personnel conducting delivery. These factors affect the chances of survival and subsequent health of mother and child.

The following Table 2.6 gives the percentage distribution of registered live births occurred in institutions by method of delivery. During 2017, the percentage share of institutional deliveries to total live birth is 96.84%. While considering the institutional wise, it is seen that out of the 133503 Live births occurred in Govt. Hospitals, 58.98% are normal deliveries and 39.89% are caesarians. But in case of private hospitals, out of 354196 live births occurred, the percentage of normal deliveries and caesarians are 54.51% and 42.10% respectively. It is also noted that in both the type of institutions, percentage of normal deliveries are more than that of caesarian. The pictorial presentation of percentage distribution of institutional live births by method of delivery are given in the following charts 2.6(i), 2.6(ii) & 2.6(iii).

2.7. Live birth by method of delivery and age of mother

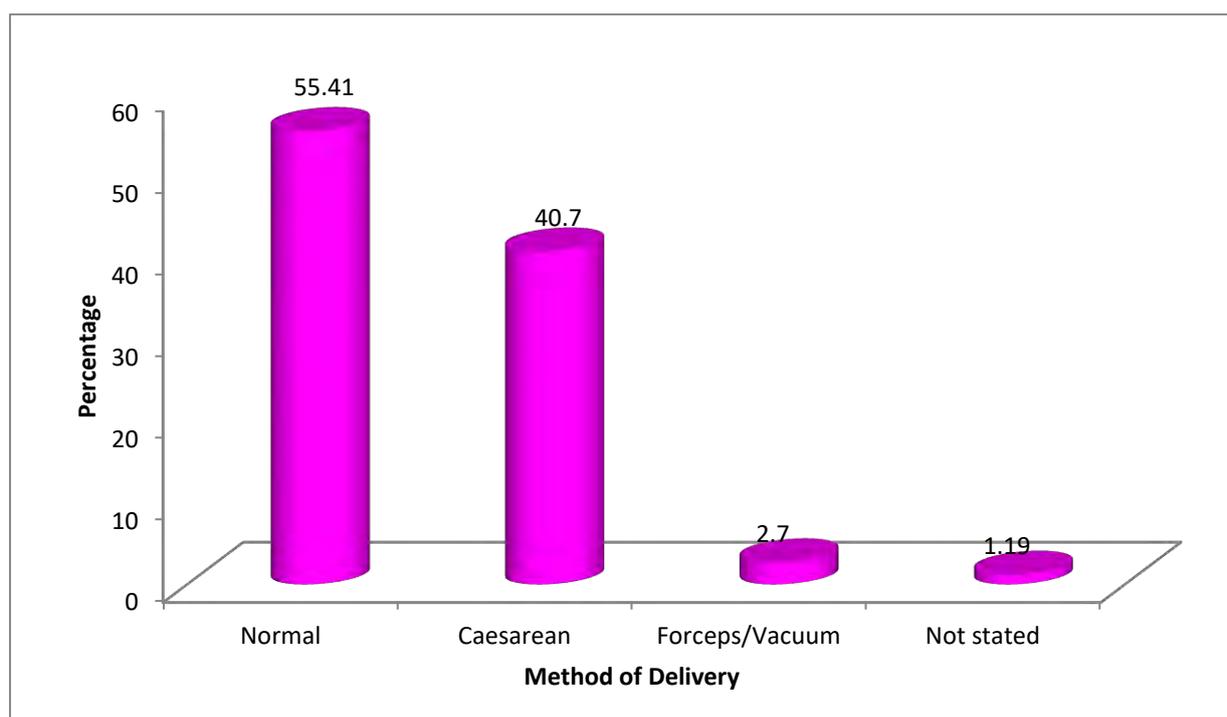

The following Table 2.7 presents the Percentage distribution of live birth by method of delivery and age group of mother. As per the percentage of live birth registered by type of attention at delivery, 55.41% are normal deliveries and 40.70% are of Caesarean. It can be observed that highest percentage of live births (37.86%) belongs to mothers in the age group 25-29, followed by the age group 20-24. In addition to this, highest percentage of normal (20.5%) as well as caesarean (16.23%) deliveries are also belongs to the 25-29 age group.

2.8. Live births by age of mother and birth order

Table 2.8 below presents the distribution of live births by age of mother and birth order. The data reveals that in the reproductive age group of 15-49, highest number of live births were reported for the mothers in the age group of 25-29(37.87%), followed by the age group 20-24 (32.08%) and there after it declined gradually with increase in age. It is to be noted that 4.48% of live births belong to the age group 15-19. It can be seen that the fertility of women decreases with increase in the age and in the age group 45 and above, there is a small percentage of live births registered (0.06%) during 2017.

2.9. Live births by Educational level of mother and father

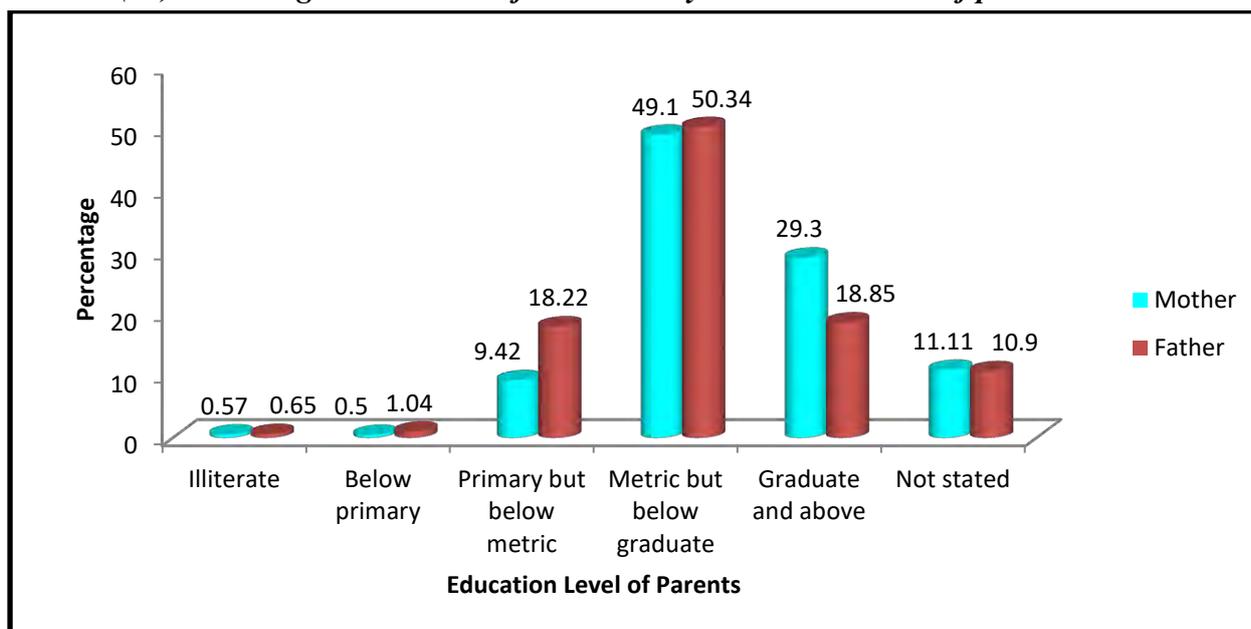

Table 2.9 shown below the percentage distribution of live births according to the level of education of father and mother. While considering the educational level of mother, highest percentage of birth is registered in the category “Metric but below graduates”, followed by “Graduate and above” and there after “Primary but below metric”. In the case of educational level of father also, the same pattern is following. In both the case of educational level of mother and father, percentage is very small in all other categories.

Following Table 2.11 presents the percentage distribution of live birth by duration of marriage of mother and birth order. It reveals that 54.22% - of births were occurred to young couples having duration of marriage 0-4 years and 30.92% of live births within 5-9 years after marriage. Obviously higher proportion of births (44.66%) was of first order for the young couples having duration of marriage 0-4 years.

2.12. Live births by duration of pregnancy and birth weight

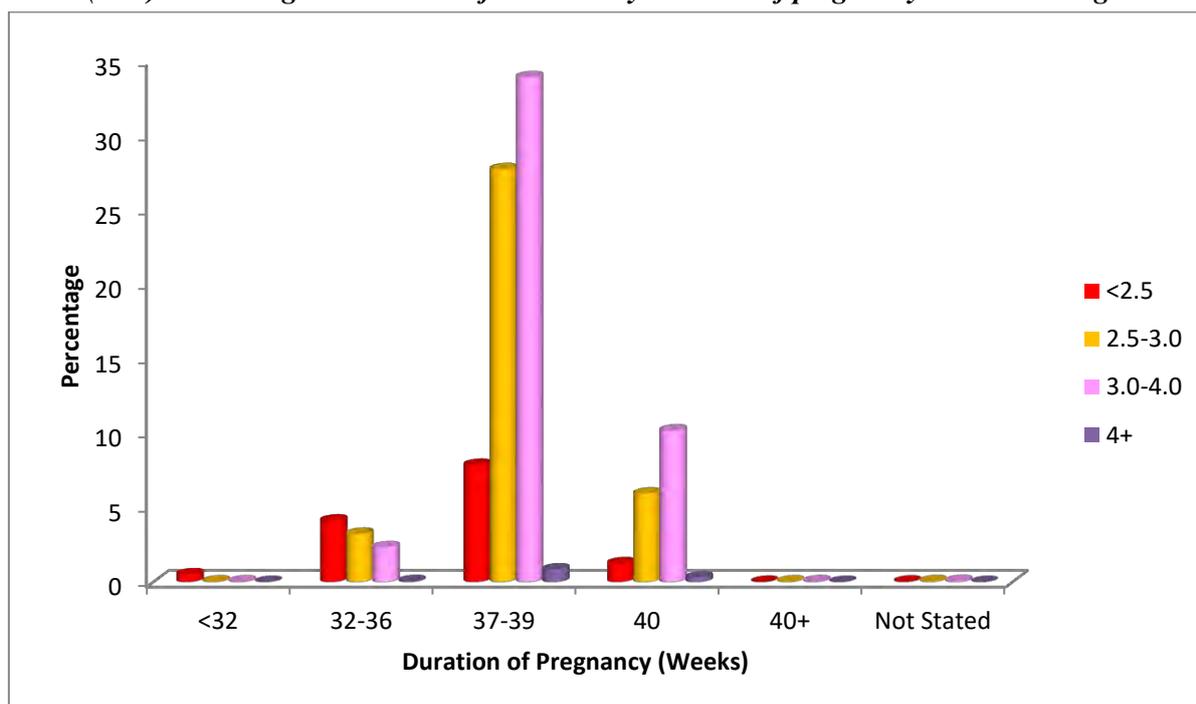

One of the important causes of still birth and infant death is due to premature delivery. Again premature babies having low birth weight (less than 2.5kg) are susceptible to diseases. Out of the total live birth registered during the year 2017, 13.82% were born with low birth weight. A clear association between duration of pregnancy and birth weight can be observed in the following Table 2.12. It is seen that 36.99% of babies having birth weight between 2.500-3.000 kg. and 46.53% of babies having weight between 3.000 -4.000 kg and only 1.21% of babies having birth weight above 4kg. Also it can be seen that 70.31% deliveries were occurred within the pregnancy period of 37-39 weeks and only 0.63% of deliveries occurred below the pregnancy period of 32 weeks.

The following Table 2.11 presents the percentage distribution of live birth by age of mother and birth weight. It is observed that out of total births occurred, 13.82% of infants had a low birth weight of less than 2.5 kg and it is more in the mother's age group 25-29 (4.95%), followed by the age group 20-24 and 30-34. It is also observed that highest percentage of babies (46.53%) have the weight of 3.000-4.000 kg and in this category, it is more in the mothers age group 25-29(18.26%).

3.4. Medical attention received at the time of death

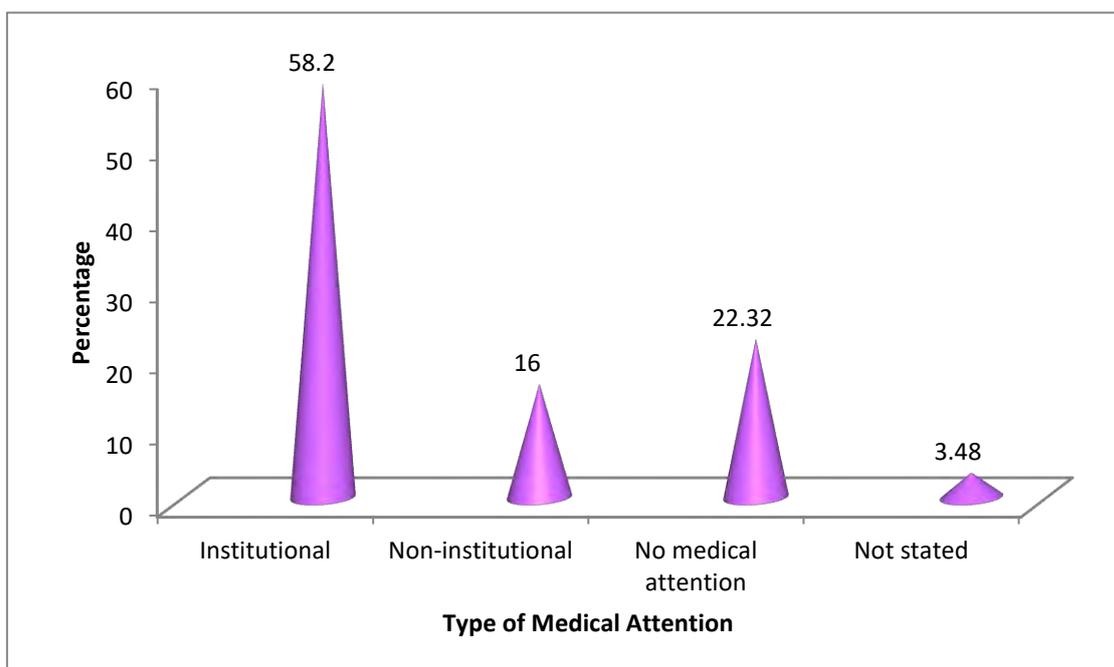

Table 3.4(i) and 3.4(ii) shows the percentage distribution of medical attention, received by the deceased at the time of death. It is evident from the Table 3.4(i) is that 58.20% of total registered deaths have occurred in institutions and 16.00% in Non Institutions. Out of 58.20% of institutional deaths, 30.55% of deaths were reported from rural areas and 27.65% deaths from urban areas. Similarly in the case of 16.00% of Non-institutional deaths, share of rural and urban sectors are 12.68% and 3.32% respectively. It is also seen that percentage of events in rural area is higher than that of urban area. Another feature observed is that 22.32% of deceased have not received any medical attention at the time of death.

It may be observed that the share of rural area is only 31.86% while that of urban area is 68.14% in total registered infant deaths during the year. At the state level, the percentage share of infant deaths to total deaths in the year 2017 is 1.21%

Also, the Table 4.1.(ii) shows the Percentage distribution of infant deaths by sex. It is seen that out of 3176 infant deaths, male death is 1736 (54.66%), where as that of female death is 1429 (44.99%) and the remaining 11 deaths(0.35%), sex is not reported. Analysis of Vital Rates

6.1 Sex Ratio at Birth (SRB)

The sex ratio at birth is defined as the number of female live births per 1,000 male live births and it is an important indicator to map the sex differential of the population at the beginning of their life. Sex Ratio at birth for the year 2017 is 964 whereas it is 954 for the year 2016. Among the districts, highest SRB has been reported in Wayanad (987) and the lowest in Kasargod (941).

6.2 Crude Birth Rate(CBR)

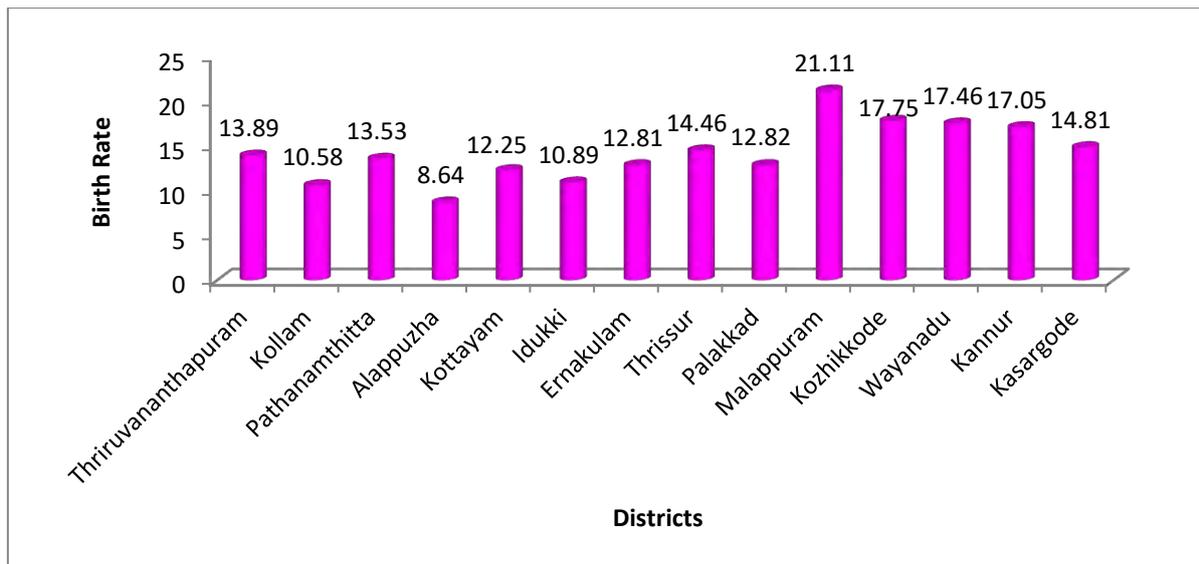

The crude birth rate is the number of live births occurring among the population of a given geographical area during a given year, per 1,000 mid-year total population of the given geographical area during the same year. In short, CBR is the number of live births in a year per 1000 of the population and it shows the growth or decline of population in a region. During the year 2017, the CBR is 14.62, whereas it is 14.48 during 2016, which shows a marginal increase of 0.14. Generally, Crude Birth Rate in the State shows a decreasing tendency. A declining trend has been observed in the CBR during 1997-2017 from the chart below.

Chart-6.2(i)-Trend in Crude Birth Rate –Kerala (1997-2017)

The graphical representation of birth rate of districts in the State during the year 2017 is depicted in the following chart-6.2(ii). The District wise analysis of the vital events shows that the highest birth rate was recorded in respect Malappuram district (21.11), followed by Kozhikkod (17.75), Wayanadu (17.46) and the lowest in Alappuzha (8.64).

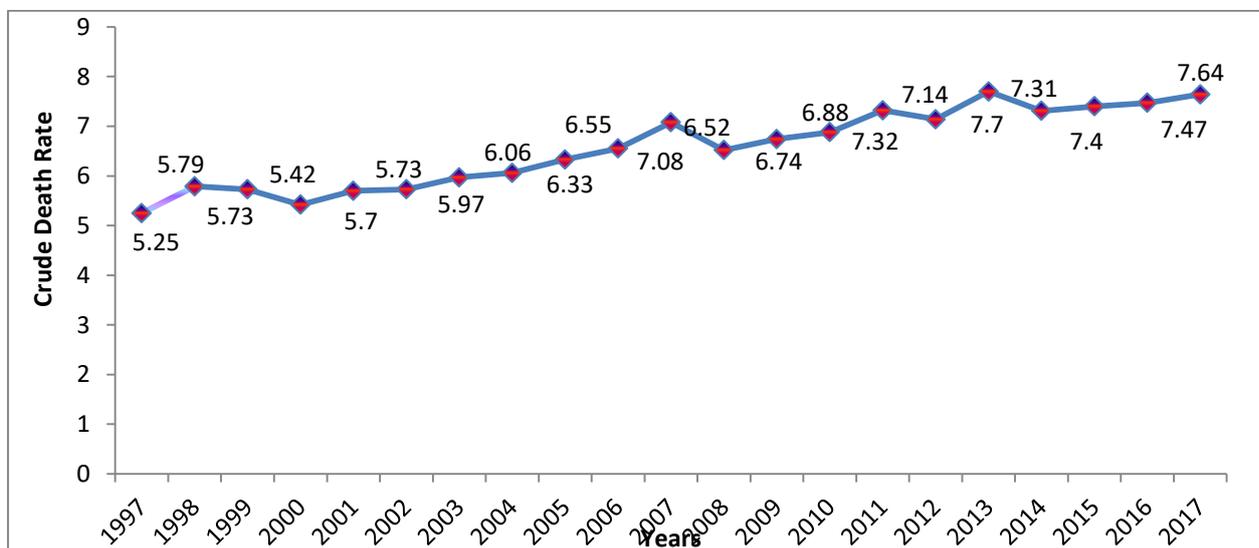

Chart 6.2(ii):- District wise Birth Rate – 2017

6.3 Crude Death Rate (CDR)

Crude Death Rate (CDR) is the total number of deaths per year per 1,000 people. The Crude Death Rate (CDR) of the State during past 21 years is presented in the chart given below. From the chart given below, it is observed that the CDR was 7.32 in 2011. During the year 2014 it was 7.31 and it increased in 2017 to 7.64.

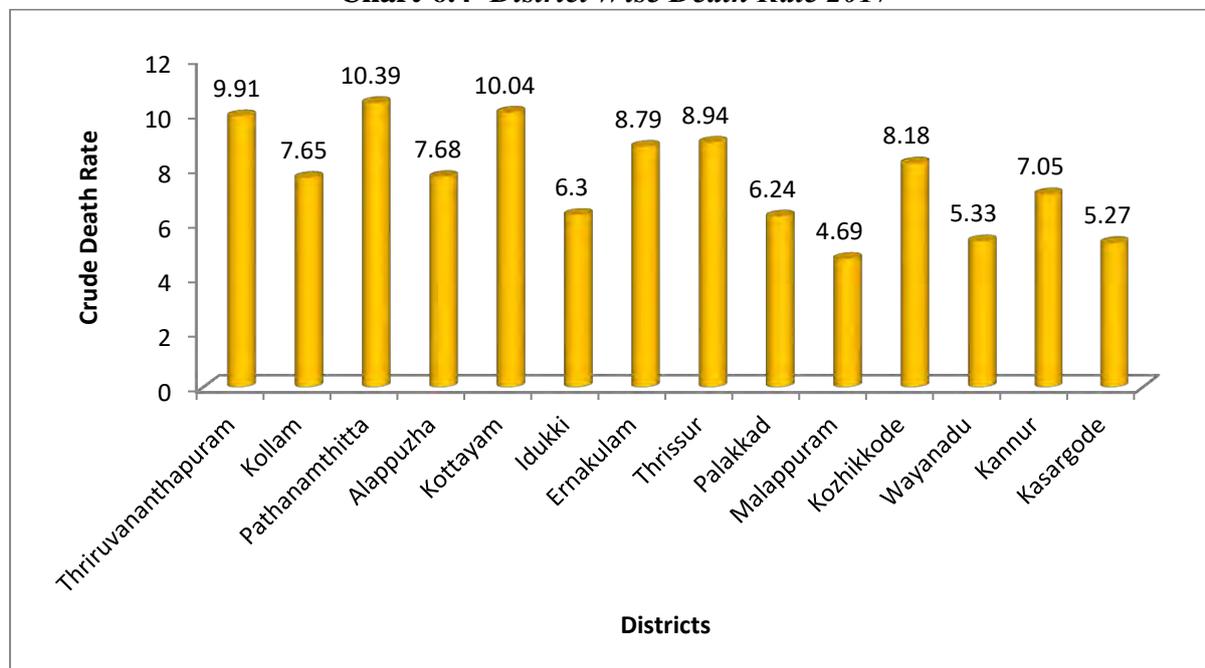

Chart-6.3-Crude Death Rate (1997-2017)

6.4 District Wise Death Rate 2017

District wise death rates are shown in the chart below. Among the districts the highest death rate 10.39 was recorded in Pathanamthitta followed by Kottayam (10.04) and the lowest in Malappuram (4.69) followed by Kasargode (5.27)

Chart-6.4- District Wise Death Rate 2017

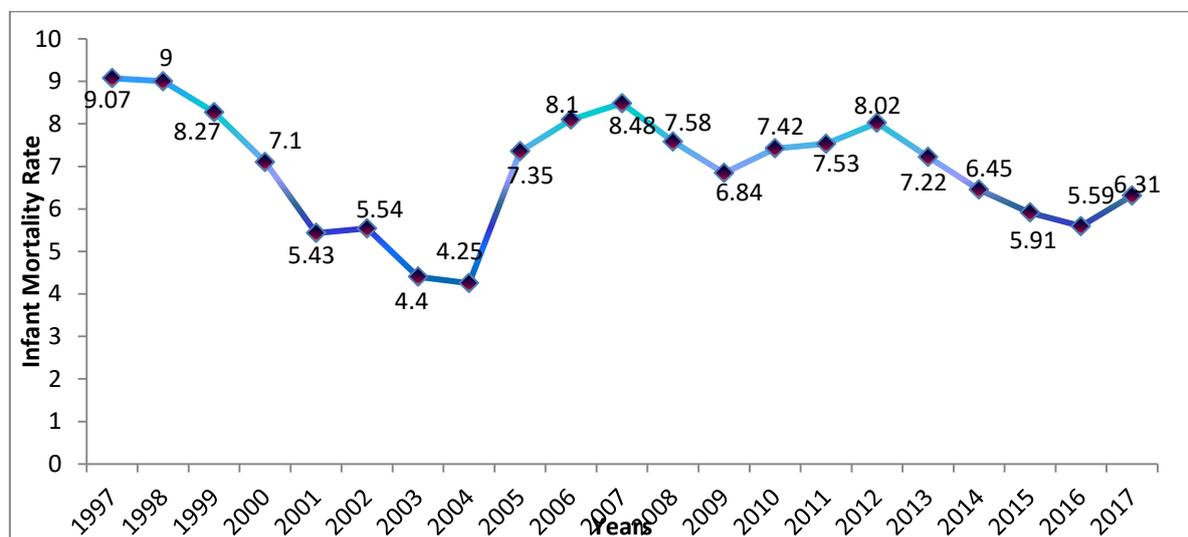

6.5 Infant Mortality Rate (IMR)

Infant Mortality Rate is defined as the infant deaths (deaths of a child less than one year old) per thousand live births. Infant mortality rate is a widely used indicator as it provides valuable insights into the health infrastructure and health status of a country.

Infant Mortality of the State during 2017 was 6.31 where as it is 5.91 during 2016. IMR of the state during the past 21 years is given in the chart. It is evident from the chart that IMR has decreased from 9.07 in 1997 to 6.31 in 2017.

Chart-6.5-Infant Mortality Rates (1997-2017)

6.5.1 Infant Mortality Rate-District wise

The Table 6.5.1 given below presents the District wise and Sex wise Infant Mortality Rate for the year 2017. Among the districts, it varies from 1.85 in Kollam to 13.48 in Kozhikkode. It is seen that IMR of Male is higher than female in all districts except in Alappuzha.

6.6. Maternal Mortality Ratio (MMR)

Maternal Death means death of a woman while pregnant or within 42 days of termination of pregnancy, irrespective of the duration and site of the pregnancy, from any cause related to or aggravated by the pregnancy or its management but not from accidental or incidental causes. Maternal Mortality Ratio (MMR) is defined as the ratio of the number of maternal deaths during a given time period per 1,00,000 live births during the same time period. The MMR is used as a measure of the quality of a health care system.

Maternal Mortality Ratio at state level for the year 2017 was computed as 24 where as it is 26 during 2016, which shows a marginal decline of 2 points.

6.7 Still Birth Rate (SBR):

The World Health Organization (WHO) defines a still birth as a baby born with no signs of life at or after 28 weeks' gestation. SRB is estimated as the ratio of number of still births per one thousand live births and still births during the year.

The SBR came down to 4.58 in 2017 from 4.60 in 2016.

6.7. Conclusion

It is worthwhile to mention that CRS is the only source, which can provide vital rates at below state level. Even though cent percentage registration has attained in the case of births, under registration of deaths still exist. Level of registration of maternal deaths and infant deaths are comparatively better. There is also need to correctly identify the maternal deaths for estimating the vital indicator MMR. All events of maternal deaths and infant deaths has to be registered to ensure accuracy of rates such as IMR, MMR etc., which are essential for health planning. Hence more care should be given to the proper implementation and monitoring of Civil Registration System.

Again certain flaws have been noticed while processing the data received from the registration authorities. These defects might have been occurred during the reporting of events. Normally the primary data on vital events are collected at the place where the event happened normally the hospital itself. Lack of knowledge regarding the schedule and the reporting procedure tends to mistakes which generally cannot be rectified at any further stages of data entry or data processing.

DEFINITIONS USED IN THIS REPORT

1. **Sex ratio** is defined as the number of females per 1000 males in a population

$$\text{Sex Ratio} = \frac{\text{Number of females} \times 1000}{\text{Number of males}}$$

2. **Sex Ratio at birth** = $\frac{\text{Number of female birth registered during the year} \times 1000}{\text{Number of male birth registered during the year}}$

3. **Masculinity proportion** is the proportion of males in the total population.

$$\text{Masculinity proportion} = \frac{\text{Number of males in the Mid year population}}{\text{Total Mid year population}} \times 1000$$

4. **Aged – Child ratio** indicates whether or not a population is young or ageing

$$\text{Aged child ratio} = \frac{\text{Population of above 60 yrs}}{\text{Population of below 15 yrs}} \times 100$$

5. **(Total)Dependency ratio** is an age-population ratio of those typically not in the labour force (the dependent part) and those typically in the labour force (the productive part). It is used to measure the pressure on productive population. The dependent part usually includes those under the age of 15 and over the age of 64. The productive part makes up the population in between, ages 15 – 64. It is normally expressed as a percentage. The **(total) dependency ratio** can be decomposed into the **child dependency ratio** and the **aged dependency ratio**.

$$\text{Total dependency ratio} = \frac{(\text{Population of 0-14 years} + \text{Population of above 65 years})}{\text{Population of 15-64 years}} \times 100$$

$$\text{Young (child) dependency ratio} = \frac{\text{Population of 0-14 ages}}{\text{Population of 15-64 ages}} \times 100$$

$$\text{Old (aged) dependency ratio} = \frac{\text{Population of above 65 years}}{\text{Population of 15-64 ages}} \times 100$$

6. **Crude Birth Rate(CBR)** is the number of live births in a year per thousand of population.

$$\text{Crude Birth Rate} = \frac{\text{Number of Live births during the year}}{\text{Mid-year population}} \times 1000$$

7. **General Fertility Rate(GFR)** is the total number of live births per 1,000 women of childbearing age (ages 15 to 49 years old) in a year.

$$\text{General Fertility Rate} = \frac{\text{Number of live births in a year}}{\text{Mid-year female population in the age group (15-49) years}} \times 1000$$

8. **Age Specific Fertility Rate (ASFR)** is the number of live births per 1,000 women in a particular age groups (usually age 15-19, 20-24 etc.) in a year

$$\text{Age Specific Fertility Rate} = \frac{\text{Number of live birth in a particular age group}}{\text{Mid-year female population of the same age group}} \times 1000$$

9. **Total Fertility Rate** may be defined as average number of children that would be born to a woman if she experiences the current fertility pattern throughout her reproductive span (15-49 years).

$$\text{Total fertility rate} = \frac{5 \times \sum_{15-19}^{45-49} \text{ASFR}}{1000}$$

10. **Gross Reproduction Rate (GRR)** is the average number of daughters that would be born to a woman (or a group of women) if she survived at least to the age of 45 and conformed to the age-specific fertility rate of a given year. It is often regarded as the extent to which the generation of daughters replaces the preceding generation of females.

$$\text{Gross reproduction rate} = \frac{5 \times \sum_{15-19}^{45-49} \text{ASFR for female live births}}{1000}$$

11. Child-woman ratio is the number of children aged 0 to 4 per 1,000 women of childbearing age. It is used as an index of fertility when reliable birth statistics are not available.

$$\text{Child-women ratio} = \frac{\text{Population of 0-4 age group}}{\text{Female population in the age group 15-49}} \times 1000$$

12. Crude Death Rate (CDR) is the total number of deaths per year per 1000 people

$$\text{Crude death rate} = \frac{\text{Number of deaths during the year}}{\text{Mid-year population}} \times 1000$$

13. Infant Mortality Rate (IMR) is the number of deaths of children less than 1 year old per 1000 live births.

$$\text{Infant mortality rate} = \frac{\text{Number of infant deaths during the year}}{\text{Number of live births during the year}} \times 1000$$

14. Neo-natal Mortality Rate (NMR) is the number of deaths during the first 28 completed days of life per 1,000 live births in a given year or period. **Neo-natal deaths** may be subdivided into **early neo-natal deaths**, occurring during the first seven days of life, and **late neo-natal deaths**, occurring after the seventh day but before the 28 completed days of life. **Postneo-natal mortality rate** is the number of deaths after 28 days of life but before one year per 1,000 live births in a given year or period. **Perineo-natal mortality rate** is the number of deaths between the foetal viability (22 weeks gestation) and the end of the 7th day after delivery per 1,000 live births in a given year or period.

$$\text{Neo-natal mortality rate} = \frac{\text{Number of infant deaths} < \text{than 29 days during the year}}{1000 \text{Number of live births during the year}} \times$$

$$\text{Early neo-natal mortality rate} = \frac{\text{Number of infant deaths} < \text{than 7 days during the year}}{\text{Number of live births during the year}} \times 1000$$

$$\text{Late neo-natal mortality rate} = \frac{\text{Number of infant deaths of 7 days to} < \text{than 29 days during the year}}{\text{Number of live births during the year}} \times 1000$$

$$\text{Post neo-natal mortality rate} = \frac{\text{Number of infant deaths of 29 days to} < \text{than one year during the year}}{\text{Number of live births during the year}} \times 1000$$

$$\text{Peri neo-natal mortality rate} = \frac{\text{Number of still births and infant deaths of} < \text{than 7 days during the year}}{\text{Number of live births and still births during the year}} \times 1000$$

15. Still Birth Rate(SBR) is the number of fetal deaths (stillbirths) per 1,000 live births plus fetal deaths (stillbirths).

$$\text{Still birth rate} = \frac{\text{Number of still births during the year}}{\text{Number of live births and still births during the year}} \times 1000$$

16. Maternal Mortality Ratio (MMR) is the number of maternal deaths per 100000 live births and still births.

$$\text{Maternal Mortality Ratio} = \frac{\text{Number of Maternal Deaths during the year}}{\text{Number of live births and still births during the year}} \times 100000$$
