PREFACE

Civil Registration System is a continuous, permanent and compulsory recording of the occurrence and characteristics of vital events. The main objective of the Civil Registration System is to record the annual change of population at national and state level in between two successive decennial Censuses. The registration of births and deaths has been made statutory through Registration of Births and Deaths Act 1969. The act came into force on 1st April 1970 in our State.

The registering authorities at the local bodies are Secretaries of Grama Panchayats, Health Inspectors of Municipalities, Health Officers of Corporations and the Executive Officer of Kannur Cantonment. The report titled "Annual Vital Statistics Report 2009" is a compilation of the vital events reported from the registering authorities in the State.

The report is prepared by the Vital Statistics Division of the Directorate under the Supervision and control of Smt.E. Baby, Additional Director (G) and Additional Chief Registrar of Births & Deaths. The sincere efforts put in by Smt.L.B Lishamol, Statistical Assistant Gr.I with assistance of Shri.B.R.Prasanth, Statistical Assistant Gr.I and Shri. U.Suresh, Research Assistant and timely advice and guidance given by Shri. Sreekumar.B, Deputy Director (VS) & Deputy Chief Registrar of Births & Deaths made this publication a reality. I appreciate the collective efforts of the above Officers in this endeavour.

I would like to place on record the co-operation and valuable services rendered by the Local Registrars, District Registrars, Deputy Directors and staff in the District Statistical Offices for bringing out this publication.

I hope that this report would immensely benefit those who work in the Health sector and Researchers in the field.

Suggestions for improvement are most welcome.

DEFINITIONS USED IN THIS REPORT

1. **Sex ratio** is the ratio of females to males in a population measured per thousand males.

$$\text{Sex ratio} = \frac{\text{Number of female births during the year}}{\text{Number of male births during the year}} \times 1000$$

2. The **masculinity proportion** is the proportion of males in the total population.

$$\text{Masculinity proportion} = \frac{\text{Number of males in the Mid year population}}{\text{Total Mid year population}} \times 1000$$

3. The **Aged – child ratio** indicates whether or not a population is young or ageing

$$\text{Aged child ratio} = \frac{\text{Population of above 60 yrs}}{\text{Population of below 15 yrs}} \times 100$$

4. The **(Total) dependency ratio** is an age-population ratio of those typically not in the labour force (the dependent part) and those typically in the labour force (the productive part). It is used to measure the pressure on productive population. The dependent part usually includes those under the age of 15 and over the age of 64. The productive part makes up the population in between, ages 15 ó 64. It is normally expressed as a percentage. The **(total) dependency ratio** can be decomposed into the **child dependency ratio** and the **aged dependency ratio**.

$$\text{Total dependency ratio} = \frac{(\text{Population of 0-14 years} + \text{Population of above 65 years})}{\text{Population of 15-64 years}} \times 100$$

$$\text{Young (child) dependency ratio} = \frac{\text{Population of 0-14 ages}}{\text{Population of 15-64 years}} \times 100$$

Population of 15-64 ages

$$\text{Old (aged) dependency ratio} = \frac{\text{Population of above 65 years}}{\text{Population of 15-64 ages}} \times 100$$

5. **Crude Birth Rate(CBR)** is the nativity or childbirths per 1,000 people per year When the crude birth rate is subtracted from the crude death rate, it reveals the rate of natural increase.

$$\text{Crude birth rate} = \frac{\text{Number of Live birth during the year}}{\text{Mid-year population}} \times 1000$$

6. The **General Fertility Rate (GFR)** is the annual number of live births per 1,000 women of childbearing age (often taken to be from 15 to 49 years old).

$$\text{General fertility rate} = \frac{\text{Number of live births in a year}}{\text{Mid-year female population in the age group (15-49) years}} \times 1000$$

7. **Age Specific Fertility Rate (ASFR)** is the annual number of live births per 1,000 women in particular age groups (usually age 15-19, 20-24 etc.)

$$\text{Age specific fertility rate} = \frac{\text{Number of live birth in a particular age group}}{\text{Mid-year female population of the same age group}} \times 1000$$

8. The **Total Fertility Rate (TFR)** of a population is the average number of children that would be born to a woman over her lifetime if (1) she were to experience the exact current age-specific fertility rates (ASFRs) through her lifetime, and (2) she were to survive from birth through the end of her reproductive life. It is obtained by summing the single-year age-specific rates at a given time.

$$\begin{aligned}
 &= (\text{Sum of age specific fertility rates over different age groups}) \\
 &\quad \times (\text{Width of age group}) / 1000 \\
 \text{Total fertility rate} &= \frac{5 \times \sum_{15-49}^{\text{ASFR}}}{1000}
 \end{aligned}$$

9. The **Gross Reproduction Rate (GRR)** is the average number of daughters that would be born to a woman (or a group of women) if she survived at least to the age of 45 and conformed to the age-specific fertility rate of a given year. It is often regarded as the extent to which the generation of daughters replaces the preceding generation of females.

$$\begin{aligned}
 &5 \times \sum_{15-49}^{\text{ASFR}} \text{ for female live births} \\
 \text{Gross reproduction rate} &= \frac{5 \times \sum_{15-49}^{\text{ASFR}}}{1000}
 \end{aligned}$$

10. The **Child-woman ratio** is the number of children aged 0 to 4 per 1,000 women of childbearing age. It is used as an index of fertility when reliable birth statistics are not available.

$$\begin{aligned}
 &\text{Population of 0-4 age group} \\
 &\quad \cdots \cdots \cdots \quad \times 1000 \\
 \text{Child-women ratio} &= \frac{\text{Population of 0-4 age group}}{\text{Female population in the age group 15-49}}
 \end{aligned}$$

11. The **Crude Death Rate (CDR)** is the total number of deaths per year per 1000 people
- $$\begin{aligned}
 &\text{Number of deaths during the year} \\
 &\quad \cdots \cdots \cdots \quad \times 1000 \\
 \text{Crude death rate} &= \frac{\text{Number of deaths during the year}}{\text{Mid-year population}}
 \end{aligned}$$

12. The **Infant Mortality Rate (IMR)** is the number of deaths of children less than 1 year old per 1000 live births.

$$\begin{aligned}
 &\text{Number of infant deaths during the year} \\
 \text{Infant mortality rate} &= \frac{\text{Number of infant deaths during the year}}{\text{Number of live births during the year}} \quad \times 1000
 \end{aligned}$$

13. **Neo-natal mortality rate** is the number of deaths during the first 28 completed days of life per 1,000 live births in a given year or period. **Neonatal deaths** may be subdivided into **early neonatal deaths**, occurring during the first seven days of life, and **late neonatal deaths**, occurring after the seventh day but before the 28 completed days of life. **Postneonatal mortality rate** is the number of deaths after 28 days of life but before one year per 1,000 live births in a given year or period. **Perineonatal mortality**

rate is the number of deaths between the foetal viability (22 weeks gestation) and the end of the 7th day after delivery per 1,000 live births in a given year or period.

Neo-natal mortality rate	$= \frac{\text{Number of infant deaths} < \text{than 29 days during the year}}{\text{Number of live births during the year}} \times 1000$
Early neo- natal mortality rate	$= \frac{\text{Number of infant deaths} < \text{than 7 days during the year}}{\text{Number of live births during the year}} \times 1000$
Late neo- natal mortality rate	$= \frac{\text{Number of infant deaths of 7 days to} < \text{than 29 days during the year}}{\text{Number of live births during the year}} \times 1000$
Post neo- natal mortality rate	$= \frac{\text{Number of infant deaths of 29 days to} < \text{than one year during the year}}{\text{Number of live births during the year}} \times 1000$
Peri neo- natal mortality rate	$= \frac{\text{Number of still births and infant deaths of} < \text{than 7 days during the year}}{\text{Number of live births and still births during the year}} \times 1000$

14. **Still birth rate** is the number of fetal deaths (stillbirths) per 1,000 live births plus fetal deaths (stillbirths).

Still birth rate	$= \frac{\text{Number of still births during the year}}{\text{Number of live births and still births during the year}} \times 1000$
------------------	---

15. **Maternal Death Rate** is the number of maternal deaths per thousand live births and still births.

Maternal Death Rate	$= \frac{\text{Number of Maternal Deaths during the year}}{\text{Number of live births and still births during the year}} \times 1000$
---------------------	--

Chapter -1

The Civil Registration System in Kerala

1.1 Introduction

Registration of births and deaths is an important source for demographic data for socio-economic development and population control in developing countries. In India, the need for dependable demographic data was felt soon after independence heralding the era of Five Year planning. In the beginning, the registration of births and deaths started on voluntary basis and there was no uniformity in statistical returns resulting in both under registration and incomplete coverage. In order to unify the civil registration activities, the Civil Registration System (CRS) was introduced in India under the Registration of Births and Deaths Act (RBD Act), 1969. Civil Registration System may be defined as a continuous recording of vital events such as births, deaths and marriages occurring in a population. The basic uses of data from Civil Registration System are

- Maintenance of permanent records on births and deaths as legal documents.
- Assessment of continuous changes in population.
- Evaluation of success of socio-economic programmes by indicators based on vital events and size of population.

As a matter of fact, requirement of this system as legal proof of births and deaths should in itself be strong enough reason for any country to have a fully operational CRS. In India the registration of vital events and the administrative machinery for this purpose has been in existence for more than a century. It had been working under diversified Acts and executive instructions thus making it unsuitable for the independent India.

1.2 Registration of Births and Deaths Act 1969

This Act replaced the then existed laws and unified the system of registration through out the country. Under the RBD Act the registration of births and deaths is made compulsory. It has become mandatory on the part of head of house hold or his representative to report and register domiciliary vital events, for medical officers in charge of medical institution in respect of births and deaths occurring in these institutions. The Act also provided the statutory authority at Centre, State, District and local level. It prescribed definitions, principles, personnel and penalties connected with enforcement of the Act. It enabled Central Government to insist uniformity in registration procedures and bring out comparability in vital statistics registered in different parts of the country.

Statistics of births and deaths are compiled on the basis of Civil Registration System introduced under the Registration of Births and Deaths (RBD) Act, 1969. It is required under the Act that each vital event should be reported within 21 days from the date of occurrence of the event. This Act also provides for registration of events beyond 21 days on payment of some

penalty. In the case of large delays registration can only be done after taking the permission of the District Magistrate.

National Level

At national level the Registrar General of India (RGI) administers CRS. He is empowered to issue general directions and take steps to co-ordinate and unify the activities of Chief Registrars of the States, who are the Chief Executive authority in the states for executing the provision of RBD Act 1969 and the rules and orders made there under. They were responsible for coordinating, unifying and supervising the work of CRS within their respective state.

State Level

The Registration of Births and Deaths Act 1969 (Central Act 18 of 1969) came into force in Kerala on 1st April 1970 by the Government of India Gazette notification dated 21st march 1970 along with many other states. The Kerala Registration of Births and Deaths Rules 1970 published in G.O.(P)No.7/70/LAD dated 29th June 1970 by S.R.O.No.262/70 Gazette dated 1st July 1970 have been approved by the Government of India under section 10(1) of the said Act.

1.3 Organizational Setup in the State

- ***Chief Registrar***

The Director of Panchayaths, Government of Kerala is the Chief Registrar of Births and Deaths.

- ***Additional Chief Registrar***

The Additional Director of Economics and Statistics Department is the Additional Chief Registrar of Births and Deaths.

- ***Deputy Chief Registrar***

A Deputy Chief Registrar assists the Chief Registrar in the day-to-day affairs relating to the registration of Births and Deaths at the State level. Another Deputy Chief Registrar assists the Additional Chief Registrar who is the Deputy Director of Economics and Statistics Department.

- ***District Registrars***

The Deputy Director of Panchayaths of the 14 districts in the State are functioning as the District Registrars. The Secretaries of Corporations and Municipalities and the Executive Officer of Kannur Cantonment area are exercising the powers of District Registrars.

- ***Additional District Registrars***

The Deputy Directors of the 14 District Statistical office are functioning as the Additional District Registrars of Births and Deaths of respective revenue districts.

- ***Registrars***

The Secretaries of Grama Panchayats, Health Officers of Corporations, Health Inspectors of Municipalities and Executive Officer of Kannur Cantonment area are functioning as the Registrars of births and deaths.

1.4 The Process

The data reporting forms contain details of birth, death and still birth. Birth registration form contains information on date of occurrence/registration, usual residence of mother, place of birth, sex and weight of the child, order of birth, type of medical attention at birth, type of delivery and characteristics of the parents including their name, age, religion, educational status, occupation etc. In the case of death, information includes name, sex, age, marital status, religion, occupation, usual residence of the deceased, place of occurrence, date of occurrence/registration, cause of death, whether medically certified or not and kind of medical attention received at the time of death and characteristics of the mother, pregnancy period etc. in the case of still births. These forms have two parts: legal and statistical. The statistical part of the vital events registered in the registration units, are forwarded to the District Offices of Economics and Statistics on a monthly basis for computerisation. After computerisation, the data sets are forwarded to the Directorate in computer media on an annual basis for the preparation of the Annual Vital Statistics Report. The Vital Statistics Division of the DES prepares this report as per the methodology and instructions issued by the Registrar General of India (RGI) from time to time. The report contains district-wise statistics of births, deaths, infant deaths, still births and the related vital rates among other things. Information Kerala Mission (IKM) has provided ñSevanaö package in all the Grama Panchayats, Municipalities and Corporations for registration of births and deaths and issue of certificates.

1.5 Limitations of the data

As far as the level of registration is concerned Kerala has got cent percent record in the registration of births and 99.5 percent in the case of deaths. Some of the vital events are seen unregistered. This may be due to lack of awareness about the need and importance of registration of births and deaths and lack of registration procedure knowledge among the public. This may affect the quality of the statistical data. Efforts are being taken to create mass awareness about the importance and necessity of registration.

1.6 Status of Reporting

The local bodies, viz., the panchayats, municipalities and corporations function as the registration units of vital events in the State. The details of monthly returns due and received are shown in table A1. Utmost care has been given for the above process avoiding duplications and omissions, and eventually a cent percent reporting was achieved both in rural as well as urban areas. On comparing the population of 2001 and the estimated population of 2009 given in tables A2 & A3, it can be inferred that out of an increase of 108.05% in the total population, the rural population has an increase of 122.83% whereas that of urban is 65.87% and as regards sex-wise growth, the percentage of increase is equal for male and female (108.05%).

Chapter -2
Analysis of Vital Events – Live Births

2.1 Registered live births

The criteria followed for including the vital events are öPlace of Occurrence of eventsö and öYear of Registrationö. By using the above methodology vital events are registered in the local registration units and the number of live births registered during 2009 is 544348 as against 535738 in 2008, and 545154 during 2007. Out of the total 544348 events reported in 2009, 211336 were reported from rural areas and 333012 from urban areas.

The registered live births by sex are presented in table 2.1. This table reveals that number of male births is greater than female births. Out of total live births registered, 280194 (51.47%) are male and 263809 (48.47%) are female. However, there is 0.06 % non reporting of sex in the total live births registered in 2009. This may be due to the non recording of information from the legal part to the statistical part.

Table- 2.1
Registered live births by sex –2009

Sex	No. of births registered	%
Male	280194	51.47
Female	263809	48.47
NR	345	0.06
Total	544348	100.00

Every vital event is expected to be reported within 21 days from the date of occurrence of the event. Even though there exists a vigilant system of birth registration at the place of delivery (hospital) itself, there were delayed registrations. During 2009, out of 544348 live births registered 15.94 % were delayed registrations. It is observed that 14708 live births were registered after one year from the date of occurrence.

2.2 Live births by month of occurrence

By analyzing the seasonal live births it is evident that highest number of live births were registered during October (9.66%) followed by March (9.11%), and the least during February (7.02%). The data are shown in the following table.

Table – 2.2
Month-wise distribution of live births registered - 2009

2.3 Live birth by medical attention at birth

Table 2.3 presents the distribution of live birth by type of medical attention received at the time of delivery. A major portion of live births have occurred in an institutional framework. The emergence of numerous hospitals both in Government as well as private sector with specialist services across the State have contributed largely for a safe and hygienic delivery. In spite of having enough modern medical facilities across the State, a small portion of live births (2.5%) is still attended by the traditional birth attendant/relatives. It is worthwhile to mention that a significant proportion of live births, say, 80.42% attended by trained health professionals or occurred at health care institutions. The type of attention at delivery is not stated for 14.11% of births. It is also observed that out of 437752 institutional births, 309516 (56.86% of the total births) births occurred in private hospitals.

Table – 2.3
Percentage distribution of live birth by medical attention at birth-2009

2.4. Live birth by method of delivery

The Table 2.4(a) gives the percentage distribution of registered live births occurred in institutions by method of delivery. Among the 128236 number of Live births in the Govt. Hospitals 79134 (61.71%) are of natural and 47065 (36.70%) are caesarian. Similarly, among the 309516 of Live births in the private hospitals 180808 (58.42%) are of natural and 116164 (37.53%) are Caesarian. Aggregately, out of total 544348 live births 59.38% percentage are natural and 37.29 % are Caesarian. The above data reveals that out of total caesarian cases of 163229, about 71.17% (116164) were reported from Private Sector. This may be due to the combined effect of so many factors including the attitude of women to have hassle free delivery, commercialization of the system of delivery etc. The percentage of distribution of live births by method of delivery and institutions is given in Table 2.4(b) and a pictorial representation is given in chart no.2.4

2.5. Live births by age of mother and birth order

Table 2.5 shows the distribution of live births by age of mother and birth order. The data reveals that the highest number of live births is in the age group of 20-24 (38.74%), followed by the age group 25-29(37.36%) and there after it declined gradually with increase in age. The number of live births corresponding to the group having age below 15 is eight. It is to be noted that 5.73% of live births belong to the age group 15-19. This shows that the girls are getting married before the age of 18 years and giving birth to children. In the reproductive age group 15-49, the highest number of live births occur in the age group of 20-24. It can be seen that the fertility decreases with increase in the age and only a minute 0.02% of births occur in the age group above 45 years.

Table – 2.5
Percentage distributions of live birth by age of mother and birth order- 2009

Among the registered births, 48.47 % is of first order followed by second order and there after it gradually declined for higher birth orders. This phenomenon explains the State's low fertility levels. This pattern is similar to both rural and urban areas. This is evident from the chart given below.

2.6. Live births by Educational level of mother and father

Table 2.6 shows that only less than 1% of live births have occurred to illiterate fathers and mothers. The percentage of live birth is the highest for the parents of literacy level metric but below graduates and there after it declined gradually with increase in levels of education. From the tables B-10 and B-11, it can be seen that highest number of 10th order births have occurred to parents of literacy level primary but below metric.

Table – 2.6

2.7. Live birth by religion

Religion wise analysis of live births reveals that, of the total 544348 live births 45.51% belong to Hindu Community 37.61% belong to Muslim Community 16.62% belong to Christian Community. Again a meagre 0.14% didn't disclose their religion. High order births (3 or more) are more in Muslim community when compared with other two communities. Further, religion wise analysis of livebirths with respect to the age group of mothers reveals that Muslim women belonging to the age group of 15- 19 have higher livebirths than the other two. This fact points out that these women are getting married at the age of 18 or even before. Even though individual cases of live births occurred to mothers in the age group below 15 is negligibly small, the very existence of such a practice is a black mark to this 100% literate State.

2.8. Live birth by occupation of father and mother

Table B16 and B17 analyses the occupation of father and mother with reference to order of birth. Specific jobs like administrative, executive and managerial jobs require relatively higher educational qualification, which in turn have impact on family size. People belonging to these categories are more likely to have less number of children and the fact is evident from the tables B16 and B17.

2.9. Live birth by duration of marriage and birth order

Tables 2.9(a) & 2.9(b) present the percentage distribution of live births by duration of marriage of mother and that of live birth by duration of marriage of mother and birth order. 62.81% of births were occurred to mothers having duration of marriage 0-4 years.

When we observe the distribution of percentage of live births based on marriage of mother and birth order, it can be seen that 45.58% of first order live births occurred to mothers having 0 ó 4 years of marriage. The following table is a percentage distribution of live births by duration of marriage and birth order.

2.10. Live births by duration of pregnancy and birth weight

One of the important causes of still birth and infant death is premature delivery. Again premature babies have low birth weight(less than 2.5kg) and are susceptible to diseases. During 2009 out of 544348 live birth 13.36% were born with low birth weight. A clear association between duration of pregnancy and birth weight can be observed from Table 2.10. Cases of babies born with Low Birth Weight (LBW) decreases with increase in duration of pregnancy. It is quite evident from the Table.

2.12. Live births by birth order and birth weight

Table 2.12 reveals that birth order is not significantly associated with the birth weight. In all birth orders majority of birth falls in the category of birth weight 3-4Kg.

2.13. Live births by method of delivery and age of mother

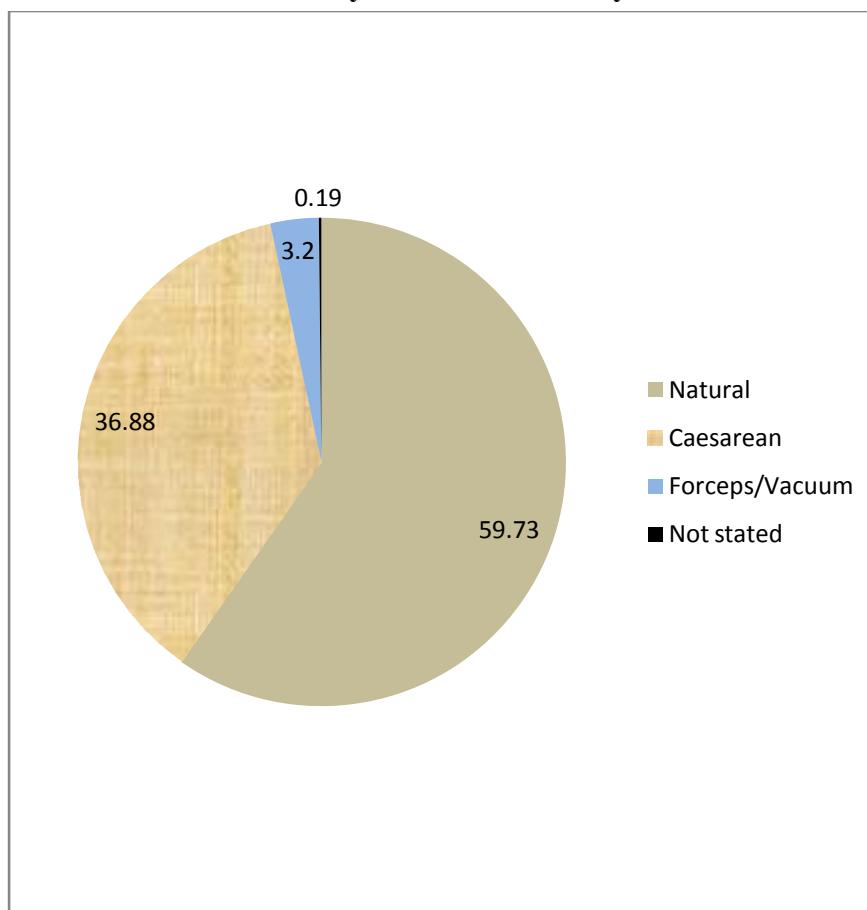

The delivery characteristics by mother's age are presented in the Table 2.13.

About 61% of deliveries are normal. As we analyses mothers age group, it can be observed that occurrence of caesarean deliveries are more in the case of mothers belonging to higher age group. This is quite evident from the Table.

Analysis of Vital Events – Deaths

3.1. Deaths by sex

2.32 lakhs deaths were registered in the state during 2009 as against 2.22 lakhs in 2008. Table 3.1 provides the distribution of registered deaths in the state during 2009. Out of the total deaths registered in 2009, males constitute 57.63%.

Table - 3. 1
Percentage Distribution of deaths by sex -2009

Sex	No of registered deaths	%
Male	133703	57.63
Female	97508	42.02

Total	232020	100

3.2. Delayed Registration

Table D3 reveals that out of 232020 deaths registered during the year 2009, 55024 were delayed registrations. It is observed that 5388 deaths were registered after one year from the date of occurrence.

3.3. Deaths by month of occurrence

Table 3.3 gives the registered deaths according to the month of occurrence. It may be observed that the occurrence of death were more in the months from June to October as compared to the first half. Highest percentage of deaths was reported in July (9.47%) followed by August and October (9.18%) and the lowest in November (7.27%).

3.4. Deaths by type of medical attention at death

Table 3.4 shows the result of medical attention, the deceased had received at the time of death. It is evident from the Table that majority of the deaths have occurred in institutions (59.00%). About 80% of deaths have occurred in institutions in urban areas as compared to 50% in rural areas. 17.77% of deaths were non-institutional but received medical attention. Non-institutional deaths are higher in rural areas (22.36 %) as compared to urban areas (8.13%). Another feature observed is that 21.85 % of deaths have not received any medical attention.

3.5. Deaths by religion and age

Percentage Distribution of deaths by religion is presented in the Table 3.5(a). 61.3% of deaths were reported from Hindus, 18.50% from Muslims and, 19.6 % from Christians. From the Table 3.5(b), it can be seen that percentage of deaths for males is greater than that of females in all religions. The percentage of deaths is observed to be the highest in the age group of more than 70 years across all the religions. It is evident from the Table 3.5(c).

3.6. Deaths by age, sex and occupation

Analysis further looked at the age pattern of mortality in the State by sex. The results have been shown in the Table 3.6 given below. It can be seen that percentage of male deaths is higher than that of females in all the age groups.

Table – 3.6

The data have been further analyzed by occupation and age group of the deceased. No particular pattern has been observed except in the category “non-workers”. The percentage distribution of deaths is the highest in the case of non-workers for all age groups.

3.7. Cause of deaths by age and sex

One of the main objectives of death registration is to know the causes of death. In 2009, 27.66% of death is due to Heart attacks followed by Asthma 14.14%, Cancer 7.2%, followed by Blood pressure and diabetes. Among the causes of death 9.92 % of the cases belong to “Old Age”. It can be observed that percentage of suicidal deaths is higher for males (2.78%) than that for females (1.28%).

Analysis of Vital Events – Infant Deaths

4.1. Infant deaths by sex

Table 4.1(a) given below presents Infant deaths by place of residence (Rural or Urban) for the year 2009 and the Table 4.1(b) gives the percentage distribution of infant death by age. It is observed that male infants experienced higher mortality than female infants.

Table-4.1(a)

4.2. Infant Deaths by age

Percentage distribution of infant deaths by age is presented in the Table 4.2. The data reveals that 65.6 % of infant deaths have been occurred to the infants aged less than one week. 16.65% of infant death belongs to the age group less than a month. Thus in Kerala majority of infant death occurred either during the first week or the first month after birth. The similar pattern could be observed in Rural and urban areas.

Analysis of Vital Events ó Still Births

5.1. Still births by sex

There were 2931 stillbirths registered in the State during 2009. Table 5.1 provides the percentage distribution of registered stillbirths by sex. It can be noticed from the Table that proportion of male stillbirths is greater than female.

Table - 5.1

5.2. Still births by age of mother

Table 5.2 shows the percentage distribution of still births by age of mother at birth. It is evident from the table that the incidence of still birth is more in the case of mothers belonging to the age group below 15 Years (11.11%) followed by 45+ age group (2.31%). The incidence of still births is below 1% in the age category between 15-39.

Chapter -6

Analysis of Vital Rates

6.1 Sex Ratio

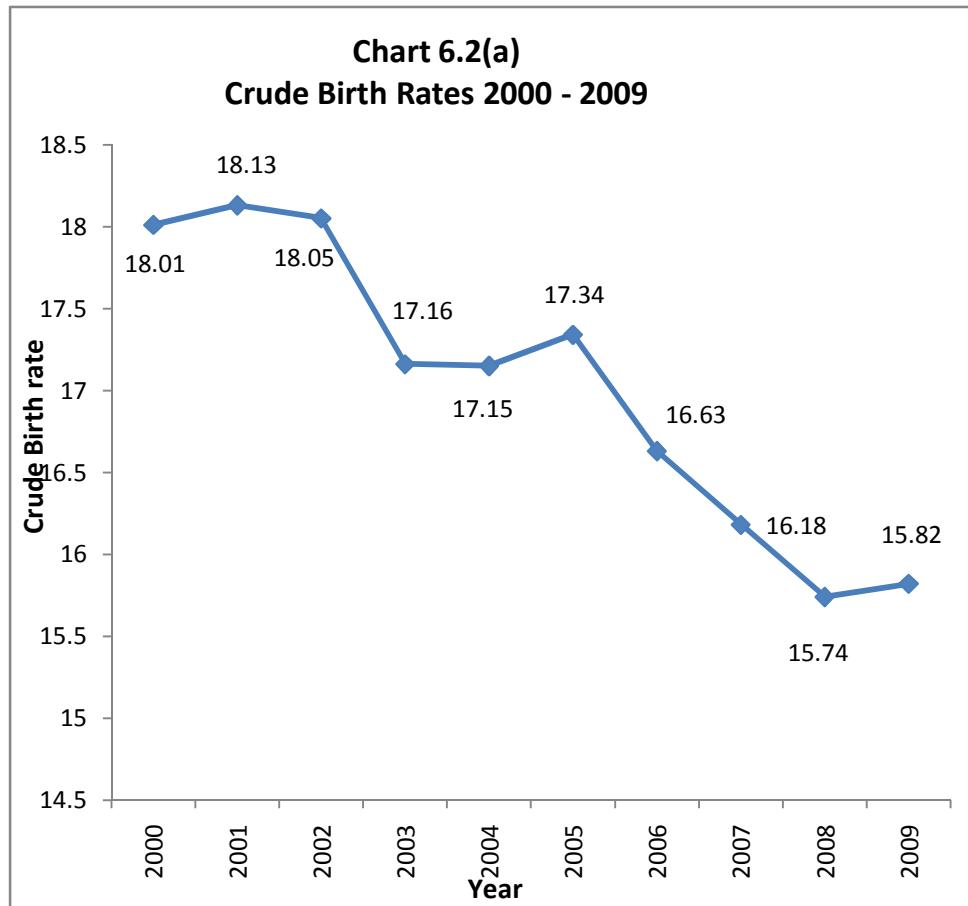

Sex Ratio at birth is worked out to be 1058 females for 1000 males. In the previous year, it was 1074 females against 1000 males.

6.2 Crude Birth Rate

Crude Birth Rate of the State shows a declining trend when we analyse the same for the last 10 years. From 18.00 in 2000 it had fallen to 15.82 in 2009. The decreasing trend for the past four years shows a faster decreasing rate than the initial years. However, the crude birth rate has marginally increased from 15.74 during 2008 to 15.82 in 2009. The Crude Birth Rates for the years from 2000 to 2009 is given in the following table and subsequent chart illustrate the pattern.

Table 6.2(a)

Year	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009
Crude Birth Rate	18.01	18.13	18.05	17.16	17.15	17.34	16.63	16.18	15.74	15.82

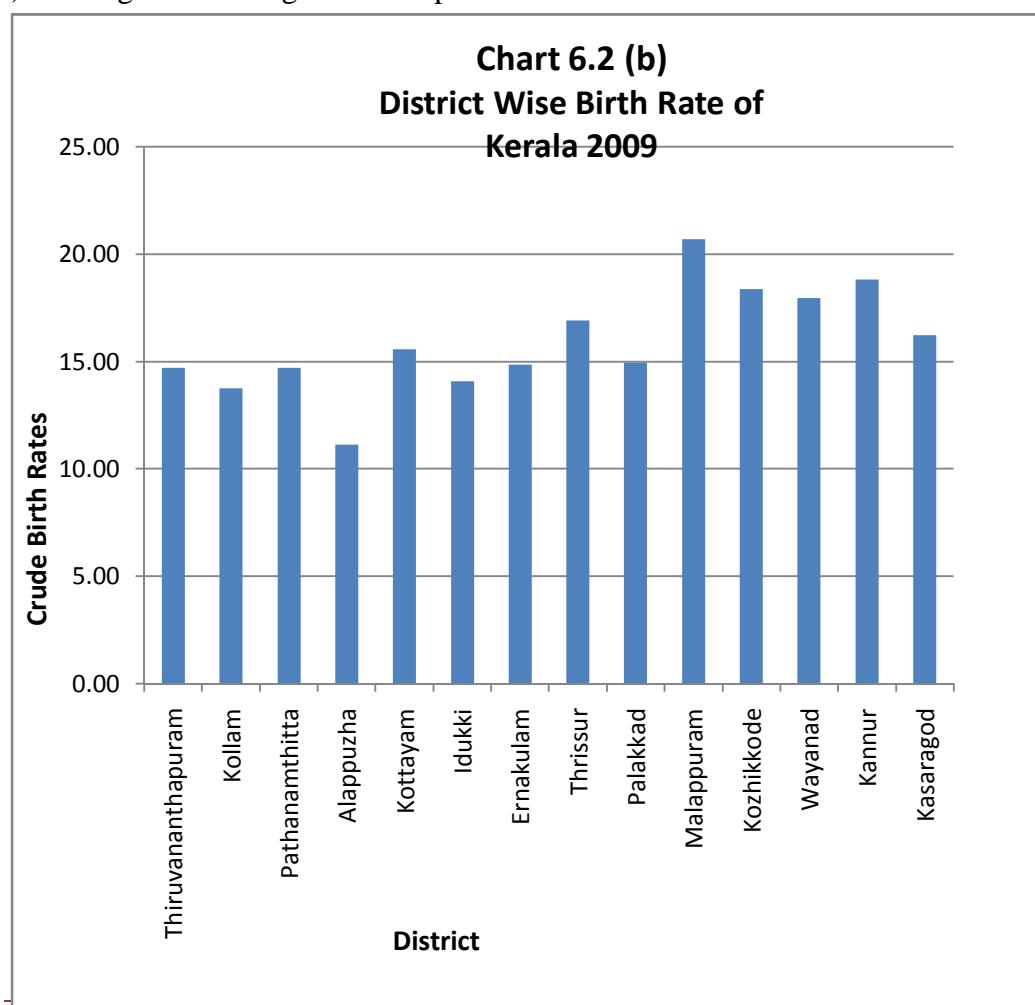

The district wise Crude Birth Rates of 2009 is given in the Table 6.2(b) and subsequent chart illustrate the pattern.

Table 6.2(b)

District	Thiruvananthapuram	Kollam	Pathanamthitta	Alappuzha	Kottayam	Idukki	Ernakulam	Thrissur	Palakkad	Malappuram	Kozhikode	Wayanad	Kannur	Kasaragod
Births Rate	14.71	13.75	14.71	11.13	15.56	14.08	14.87	16.91	14.96	20.70	18.39	17.97	18.81	16.23

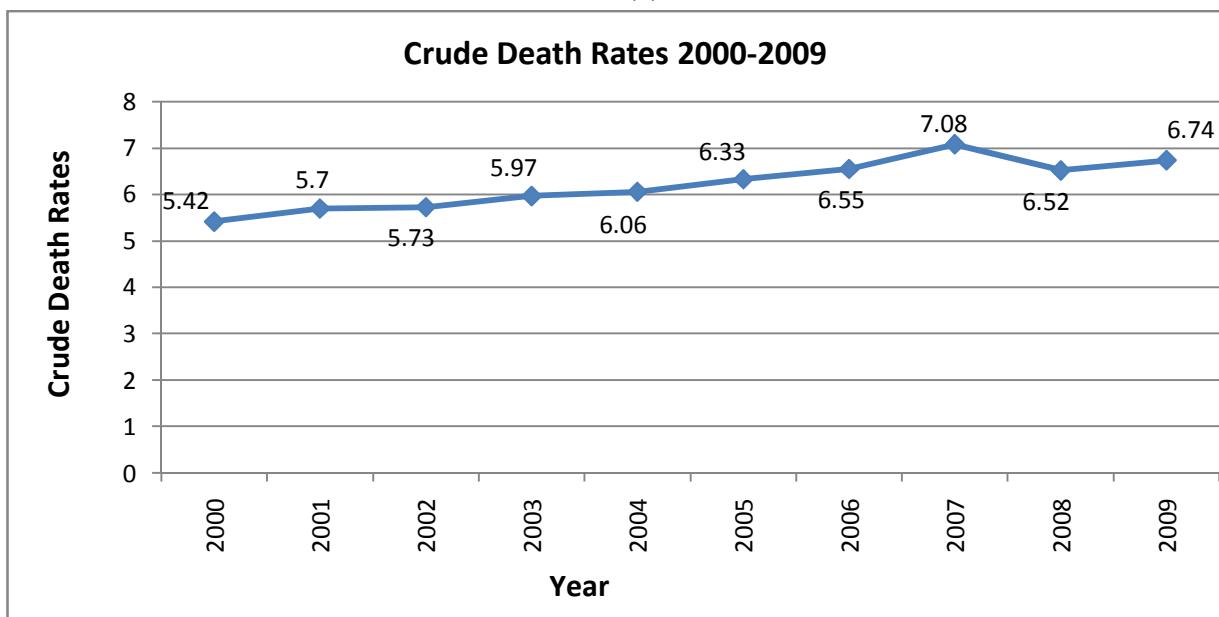

The District wise analysis of the vital events shows that the higher birth rate of 20.70% was recorded in Malappuram district, followed by Kannur (18.81%) and the lowest in Alappuzha (11.13%). Chart given below gives a comparison of the district level Crude Birth Rates.

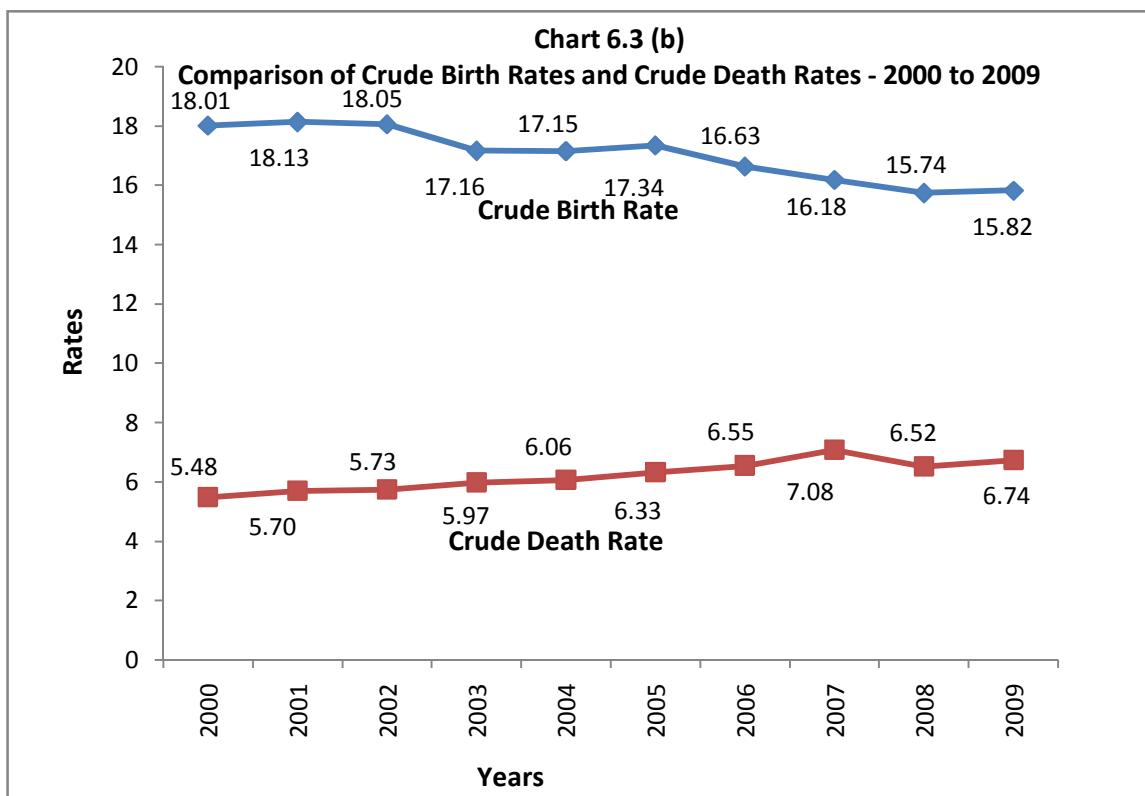

6.3 Crude Death Rate

The Crude Death Rates (CDR) of the State during past 10 years is presented in the table and chart given below. From the chart given below, it is observed that the CDR increases till 2007 and then falls to 6.52 in 2008 and then increases to 6.74 in 2009. The increase may be due to the increase in the level of registration of death.

Chart 6.3(a)

The following chart depicts the association between the birth and death rate.

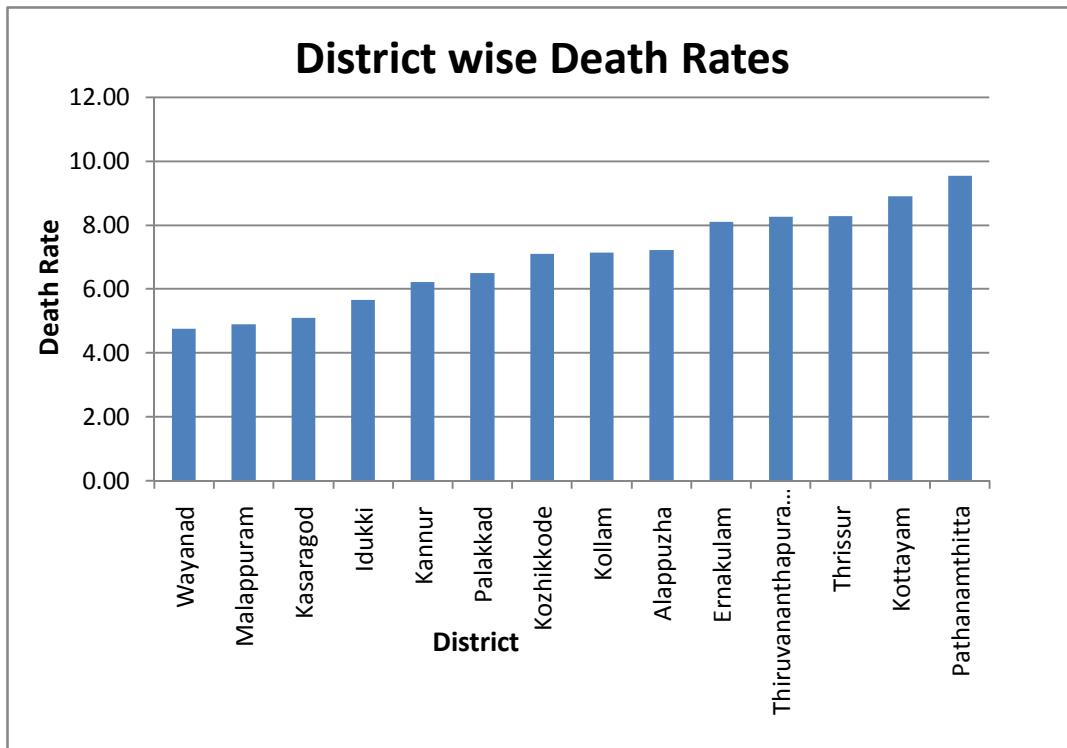

District wise death rates is shown in the table and chart below. Among the districts the highest death rate 9.53 was recorded in Pathanamthitta followed by Kottayam (8.90) and the lowest in Wayanad (4.76).

Table 6.3

Total	7.39	6.20	6.84

When we analyse the Infant Mortality Rates for the last 10 years including the current year (2009), it can be seen that the IMR shows a declining trend from 2007. The pictorial representation of the data is given in the chart 6.4(b)

Table 6.4(b)

6.5 Comparison of IMR based on CRS and SRS

IMR estimated from SRS data is higher than that worked out from CRS. This indicates that the registration of infant death is quite low. This is evident from the following table and chart. Such a low registration of infant death is a matter of concern. Since IMR is an essential requirement for any health planning, more concentration should be given for the complete registration of infant deaths.

SRS	14	11	10	11	12	14	15	13	12	12

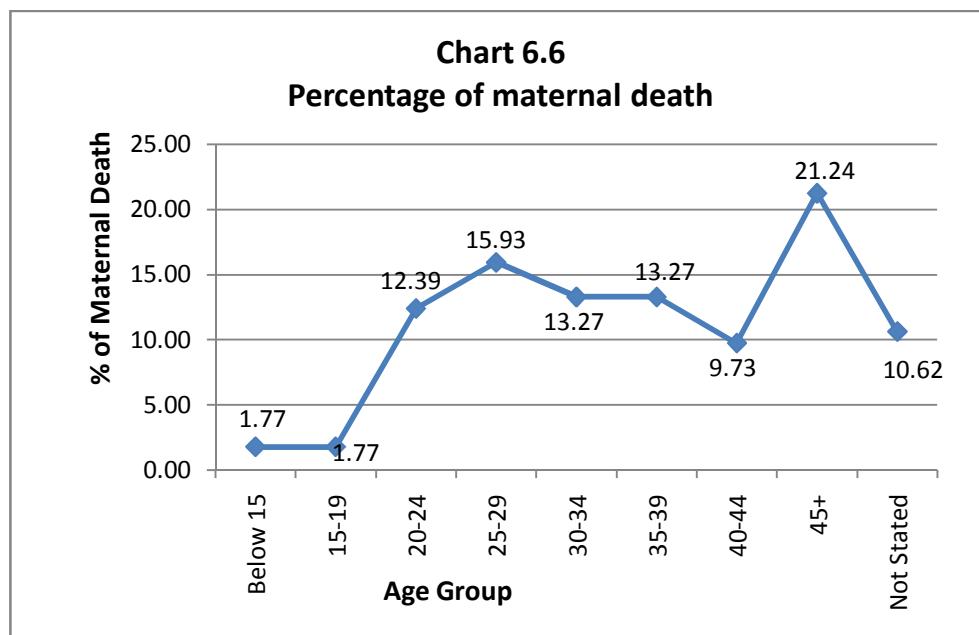

6.6. Pregnancy related deaths

Maternal mortality rate of the state for the year 2009 is computed as 0.21. Complications of pregnancy, childbirth and Heart attack are some major causes of maternal deaths in all age groups. Table 6.6 reveals that 21.24% of maternal deaths have been occurred in the age group 45+. 15.93% of maternal deaths belong to the age group 25-29.

Table -6.6
Percentage distribution of maternal death by age-2009

40-44	11	9.73
45+	24	21.24
Not Stated	12	10.62

6.7. Conclusion

It is worthwhile to mention that CRS is the only source, which can provide vital rates at below state level. Even though cent percentage registration has attained in the case of births, under registration of deaths still exist. Level of registration of maternal deaths and infant deaths are not satisfactory. There is also a need to correctly identify the maternal deaths for estimating the vital indicator MMR. Full coverage of maternal deaths and infant deaths by registration machinery only can help to calculate rates such as MMR, IMR etc, which are essential for health planning. Hence more concentration should be given to the proper implementation and monitoring of Civil Registration System.
